Mātrālakṣaṇam

INDIRA GANDHI NATIONAL CENTRE FOR THE ARTS

The *Mātrālakṣaṇam* ("Description of Mātrā") is one of the most important technical treatises belonging to the Kauthuma–Rāṇāyanīya branch of the Sāmaveda. Because it deals not merely with textual and notational formation but with the chants as they are actually sung, the tract stands apart from such works as the *Puṣpasūtra* and the *Pañcavidhasūtra*.

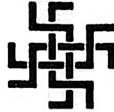

The unit of measure in the Sāmavedic chants is declared to the *mātrā*, which is the duration of a short vowel. The existence of long, augmented, and prolated vowels is then set forth. But the length of a syllable is determined not only by the duration of its vowel but also by the number of notational figures attached to the syllable. The treatise classifies syllables with two or more figures according to whether they do or do not have the time value of syllables found in the collection of source verses *(ārcika)*, where one-and two-*mātrā* durations predominate.

Throughout his translation of the entire text and most of the commentary, the author has provided copious notes, which include 127 musical transcriptions of chant fragments pertinent to the various subjects addressed by the *Mātrālakṣaṇam.* Following the translation he has attached a Translator's Postscript, which relates the rules of the treatise to the ancient Indian's concept of time. An Index of Sāmans and General Index conclude the work.

MĀTRĀLAKṢAṆAM

Text, Translation, Extracts from the Commentary, and Notes, Including References to Two Oral Traditions of South India

by
Wayne Howard

FOREWORD

Kalā Kośa Division of the Indira Gandhi National Centre for the Arts is the principal research and publication division. It will concentrate on the theoretical and textual tradition of intellectual discourse in the Indian artistic tradition. A distinctively Indian interdisciplinary system where the textual and the oral, the verbal and the visual, the scientific and the metaphysical, the transcendental and the functional were interlocked as parts of a whole is recognised, but its concepts, structure and processes are often difficult to identify. The Indira Gandhi National Centre for the Arts aims to comprehend the arts, within the context of the Indian world view, notions of space-time and interconnections at the level of theory and practice.

Emerging logically out of this perception are the four long range programmes of this division, namely, (i) *Kalātattvakośa* — A Lexicon of Fundamental Concepts and glossaries of technical terms; (ii) *Kalāmūlaśāstra* Series of fundamental texts basic to the Indian artistic traditions as also primary texts specific to particular arts; (iii) Publications, reprints, translations of works of critical scholarship such as those of A.K. Coomaraswamy; (iv) Encyclopaedia of the Arts — A multi-disciplinary, multi-volume Encyclopaedia of the Arts.

The Kalātattvakośa is the first of these programmes, complex, intricate in nature, but essential as a first prerequisite to identify fundamentals of a rare holistic system.

The Kalāmūlaśāstra is the second programme. Here critical editions of originals and translations of fundamental texts relating to the Indian Arts ranging from architecture, sculpture, painting, theatre, music, dance along with their scientific and technical commentaries will be undertaken. Attention in each of these volumes will be on the text unencumbered with the weight of some later obtuse commentaries and interpretations of a secondary nature. This series seeks to place the text in as exact a manner as is possible by considering all primary material available in any part of the world. In each case, microfilm and microfiche of the manuscripts have been obtained and made available to the editor for collation and editing. It is hoped that a new methodology of critically editing and collating texts will be established through the publication of the series.

Mātrālakṣaṇam is the first text to be published in this series. Perhaps it is one of the first attempts at transcribing the world's most complex system of orally accented verses which were transmitted through oral intonation into a written textual form. The transcribing of a complex code of oral intonation preserved through a most exacting recitative discipline presents challenges in arriving at an authentic text. The present volume is based on six damaged or incomplete manuscripts of the *Mātrālakṣaṇam* so far discovered, one printed edition in *Grantha* script (Krishnaswamy) and another in *Devanāgari* (B.R. Sharma). Obviously, the authenticity of a text cannot be restricted in this case

to a mere collation of diverse recensions of a written text. It was necessary to recheck the written text with the few traditional *Sāmaveda* chanters. Indeed, as is known, the *Śruti,* i.e. the heard word has remained eternal and immutable in the Indian tradition while the written word has changed and is also subject to variations and inaccuracies. *Mātrālakṣaṇam* thus is a true indicator of the relationship of the syllable and the intonated word, of the articulated sound and the written word. For the contemporary scholar it is important to note that in the Indian tradition, the heard word was primary and the written secondary. Logically it leads to the deduction that the oral and the literate were not placed in a hierarchical framework of an evolutionary model of development from the oral to the literate. If so, then the broader classification of civilization being divided into pre-history and history on the basis of writing needs reassessment. *Mātrālakṣaṇam* importance is enhanced by the fact that it represents two very important *Śākhās* of *Sāmaveda,* namely, Rāṇāyanīya and Kauthuma *Śākhās.* As is well known, Patañjali mentions nearly one thousand *Śākhās* of the *Sāmaveda.* Of these, only three are now extant in the living oral tradition. Of these three, there is a close similarity between the Rāṇāyaṇīya and Kauthuma *Śākhās* in their mode of syllabic intonation as also their manuals for recitation.

The contents of the *Mātrālakṣaṇam* are of fundamental importance because this is perhaps the first text to discuss the concept of a time-unit measure *(mātrā).* The importance of *mātrā* as measure with the mathematical syllabic time value of vowels in their aspects of elongation, tempo, pitch and interval cannot be understood without taking into account sound as measure. In delineating the semantic relationship between syllable and letter, vowels and consonants, it lays the foundation of disciplines today recognised as phonetics, linguistics and prosody. Equally important is the discussion on sound and notes, in doing so it is a proto fore-runner of the 'modal' system of Indian music. As an exacting system of oral articulation and recitation, this text was used for recitation with hand gestures like *ārcika.* In relating the articulation of sound with body language, gesture, especially hands and fingers, the system of orally rendering a text according to its manuals, provides the basis of the emergence of a structure of artistic expression through the body (namely *āṅgikābhinaya*). In more senses than one, Vedic intonation is a precursor of both theory and practice (*śāstra* and *prayoga)* of the arts, in their original framework of interrelatedness.

Dr. Wayne Howard is an eminent scholar dedicated to Vedic studies and music. His earlier works have been acknowledged by western and Indian scholars. It was not an easy task to arrive at an authentic text from different recensions and oral intonations of different regions, but he has accomplished this difficult task. By providing staff notation he has facilitated comprehension by those trained in western techniques.

Despite its brevity, the preparation of the manuscript for publication, rechecking the text with traditional chanters, taking hard decisions of omitting

of passages of the text on account of faulty language etc. has been a difficult matter. Apart from the traditional *Sāmavedic* chanters, other scholars like Dr. B.R. Sharma had to be consulted. Dr. C.R. Swaminathan, an eminent scholar in his own right, and his young colleagues have rendered inavaluable assistance. Thanks are acknowledged to Dr. C.R. Swaminathan and Dr. C.B. Pandey, Editor, IGNCA, for supervising the complex bilingual publication and Mr. K. Khosa for the jacket design.

CONTENTS

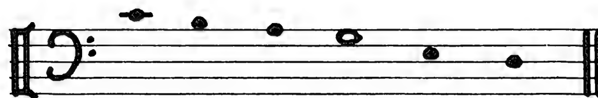

PREFACE

As far as treatises on the Sāmaveda go, the Mātrālakṣaṇa ("Description of *Mātrā*") is considered a minor work; yet its importance in facilitating comprehension of the actual musical structure of the chants is unsurpassed. In it the principle of measurement by *mātrā* ("time unit") is put forth; extracts from the songbooks (*gānas*) serve to illustrate the various points. Chapter 1 deals first of all with the durations (short, long, or prolated/augmented) of syllables having a single notated numeral; it concludes with descriptions of syllables, each with two or more figures, that have a time value surpassing the two-*mātrā* limit that is a feature of the body of source verses (*ārcika*). Chapter 2 concerns itself by and large with exceptions to the rule that each number of these multi-figure syllables bears three *mātrās*, while Chapter 3 describes the conditions under which fractional durations are present. I have dealt with many of the treatise's statements in my *Sāmavedic Chant* (1977); however, I have since changed my opinion on the import of some passages. Hence the present translation does not merely repeat what has been written in the past.

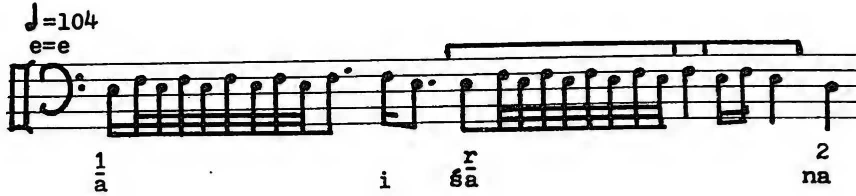

To illustrate, as far as possible, the rules of the treatise, transcribed specimens of Kauthuma-Rāṇāyanīya chant from the Tanjore District in Tamilnadu and the North Kannara District in Karnataka are offered. The Tanjore style represented here is the strongest and most widespread sāmavedic tradition in all of India. The chanters employ a seven-tone scale with a central pitch located approximately in the middle of the gamut (pitches are relative); an eighth tone is heard but rarely.

Adherents to this tradition call themselves Kauthumas, Gautamas, or Chāndosāmas; they may in fact be Rāṇāyanīyas, as are members of the Hāvik sect in North Kannara. These Sāmavedīs recognize a six-tone scale with intervallic relationships different from those of the Tanjore system, although a central pitch is prominent here as well.

Each music example in the notes to the translation shows which tradition is being illustrated, the type of note that is equivalent to one *mātrā*, the source and name of the chant from which the extract is taken, the notation, the metronomic indication, the pitch of the initial tone, and, in many cases, a formulation of overall divisions that may represent *mātrās* in a broader sense than that specified in the treatise. For example, the following fragment is from a transcription of the Rathantaram (Ūhyagāna 1.1.1), where a short syllable, under normal circumstances, is equivalent to an eighth note.

The notation 1r before 2 should last three *mātrās* (see the notes to Mātrālakṣaṇa 1.3); hence the syllable *śā* of this excerpt should theoretically have the duration of a dotted quarter note. However, it lasts instead the value of a whole note (eight *mātrās*). Nevertheless, three divisions, designated by the segmented beam above the syllable in question, are apparent. It is obvious, therefore, that in this and all performances of sāmavedic chant the value of the *mātrā* is not rigidly maintained (see the Translator's Postscript at the end of this book for a discussion of this relativistic view of timekeeping).

For the text and translation I have relied upon Oriental Institute (Baroda) Manuscript 11985, containing both text and commentary, and India Office (London) Burnell Manuscript 496k (Keith 4328), consisting of the text only. I have also benefited greatly from Prof. B. R. Sharma's edition of text and commentary.

The Baroda manuscript, the only manuscript source available with the commentary, was copied in the year 1447. In the *devanāgarī* script, it is a paper manuscript comprised of twelve folios. The disposition of the text on these twelve leaves is now presented. Decimal figures refer to chapter (*kaṇḍikā*) and precept (*śāstra*) of the Mātrālakṣaṇa, while C indicates texts of the commentary.

11v: śāstrāntare coktam (3.9C) . . . yasmiṃś cakita iṃdrādradā evam ā° (3.9C)

12r: °diṣu mātrārdhamātrikaṃ (3.9C) . . .

There are many mistakes in this manuscript, especially in the commentary portions; I have relied to a great extent on the corrections made by Prof. B. R. Sharma in his *devanāgarī* edition of both text and commentary (Sharma 1969).

The India Office manuscript, a paper document in the *grantha* script, is apparently a copy made by A. C. Burnell. It consists of two folios with the text only. The textual distribution is as follows.

1r: atha mātrālakṣaṇaṃ / athāto hrasvadīrghaplutamātrākṣarāṇi vyākhyāsyāmaḥ (1.1) . . . tṛtīyo dvitīyam atikramya prathamaṃ pratyutkrāmati punānāyām pūnā° (1.26) [3 2]

1v: 31 caturvidho 'tikramo (1.26-27) . . . dvividhā (3.1)

2r: gatir igatir ugatiś ca (3.1) . . .

On occasion this copy omits some individual letters and syllables, but it is impossible to know if these mistakes are present in the original manuscript or if they resulted from the copying process. This source gives the notation of the chant quotations, although it has been necessary to consult Nārāyaṇasvāmī 1958 (and occasionally Dīkṣita 1967 for textual sources of some of the music examples) in order to obtain accurate readings. The Baroda text is devoid of the notation.

In the present work the notated specimens are given in the commentary or, if references are absent there, in the notes.

Finally, it is my pleasant duty to acknowledge the assistance of Prof. G. H. Tarlekar (Poona) and Prof. Lewis Rowell (Indiana University), both of whom spent a great deal of time reading the entire manuscript and offering many helpful suggestions and comments. I consider myself extremely fortunate to have had the benefit of their counsel. My sincere thanks go also to the India Office Library and the Oriental Institute at Baroda for furnishing microfilm copies of the manuscript described above.

INTRODUCTION

The Core Literature of the Sāmaveda

The essence of the Sāmaveda is chant (*sāman*); in the Mātrālakṣaṇa (ML) the various laws regarding duration refer specifically to these melodies, which appear in notated form in four chantbooks (*gānas*). The ML uses quotations from the chantbooks to illustrate its rules.

Most of the chants draw their texts from the *ārcika*, the collection of source verses (*ṛc*), which is divided into two parts. The first *ārcika* (Pūrvārcika) contains verses addressed to the gods Agni, Indra, and Soma Pavamāna, in that order. Each verse of the Pūrvārcika serves as the textual basis of one or more chants in the Grāmageyagāna (Village Chantbook). Attached to the end of this *ārcika* is the Āraṇyakasaṃhitā (Forest Collection), the verses of which are esoteric and philosophic in nature. The chants of the Āraṇyakagāna (Forest Chantbook) make use of consecutive verses of the Āraṇyakasaṃhitā, although chants based upon some Pūrvārcika texts are interspersed between. Intermingled with the chants on Pūrvārcika and Āraṇyakasaṃhitā texts are those consisting entirely of *stobhas*, extratextual matter that, to varying degrees, infiltrates many chants. The Āraṇyakagāna is divided into five sections (*parvans:* this term is used also for the "sections" of a chant) with the names *arka*, *dvandva*, *vrata*, and *śukriya*. A fifth section, a supplement or *pariśiṣṭa*, is added at the end.

The chants of the Grāmageyagāna and the Āraṇyakagāna are the basis (*prakṛti*) for the derivative *(vikṛti) sāmans* that occur in the other two chantbooks; hence the village and forest chants are sometimes called collectively the Prakṛtigāna. All of the melodies cited by the ML and its commentary are drawn from the Prakṛtigāna, although the present writer has utilized transcribed specimens from all four chantbooks for illustrative purposes.

The Ūhagāna (Chantbook of Modified [Melodies]) and the Ūhyagāna or Ūharahasyagāna (Chantbook of Modified Secret [Melodies]: known also simply as the Rahasyagāna) repeat melodies, albeit with occasional modifications, from the Grāmageya- and Āraṇyakagānas, respectively. The sectional division of the Ūha- and Ūhyagānas is according to the duration of the rituals for which their chants are intended. These divisions have the names *daśarātra*, *saṃvatsara*, *ekāha*, and *ahīna;* after them are the *prāyaścitta* and *kṣudra* sections, which present *sāmans* sung for expiation and for carrying out some particular wish, respectively.

The relationship of the four chantbooks to the two *ārcikas* is shown in the following outline.

I. Pūrvārcika + Āraṇyakasaṃhitā
   A. Prakṛtigāna
      1. Grāmageyagāna (on Pūrvārcika texts only)

a. Āgneya-parvan
b. Aindra-Parvan
c. Pāvamāna-parvan
2. Āraṇyakagāna (on Pūrvārcika, Āraṇyakasaṃhitā, and *stobha* texts)
a. Arka-parvan
b. Dvandva-parvan
c. Vrata-parvan
d. Śukriya-parvan
e. Pariśiṣṭa

II. Uttarārcika
A. Uttaragāna (Vikṛti)
1. and 2. Ūhagāna (selected chants from the Grāmageyagāna) and Ūhyagāna (selected chants from the Āraṇyakagāna), each *gāna* divided into six sections:
a. Daśarātra-parvan
b. Saṃvatsara-parvan
c. Ekāha-parvan
d. Ahīna-parvan
e. Prāyaścitta-parvan
f. Kṣudra-parvan

As a rule, both of these posterior chantbooks repeat each melody three times, to different texts. The chant trilogy owes its existence to the requirements of the Vedic sacrifices, where the three statements of a *sāman* are sometimes repeated according to specified schemes. Moreover, in the sacrifices the five standard divisions (*bhaktis*) of each *sāman* are divided among three pre-selected Sāmavedic priests: the *prastāva* is sung by the Prastotṛ, the *udgītha* by Udgātṛ, the *pratihāra* by the Pratihartṛ the *upadrava* by the Udgātṛ, the *nidhana* by all three priests simultaneously. Two additional *bhaktis* result when the *hiṃkāra (him, hum,* or *hṃ)* is sung, by the three priests together, prior to the *prastāva* and when the sacred syllable *ōm* is intoned by the Udgātṛ before he sings the *udgītha*.

The most revered chant of the Sāmaveda, the Gāyatram, is somewhat of an anomaly in that it is the most recurrent chant of the two sacrificial *gānas* but yet does not appear in notated form a single time therein: the intricacies connected with the proper performance of this *sāman* (see Howard 1983: 321-25) were perhaps thought best kept secret from those who had not already undergone training as sacrificial functionaries.

As is the case with the other three Vedas (Ṛgveda, Yajurveda, Atharvaveda), the Sāmaveda can be taught only by members of the highest caste, Brāhmaṇa (Brāhmaṇ, Brāhmiṇ)—not to be confused with the *brāhmaṇa* class of literature. Sāmavedic Brāhmaṇs belong to the Kauthuma, Rāṇāyanīya, or Jaiminīya schools of singing: the ML is addressed to scholars of the Kauthuma and Rāṇāyanīya branches, the texts of which are closely related.

The Numeral Notation of the Kauthumas and Rāṇāyanīyas

The chantbook quotations in the ML make use of the numeral notation that is a feature of the Kauthuma-Rāṇāyanīya recension. The five basic figures (1–5) denote hand positions (*mudrās*) corresponding to the five fingers of the right hand: the thumb itself and the thumb touching the middle of the remaining fingers.

1 = the thumb, the first (*prathama* finger, held some distance above the forefinger.
2 = the forefinger, the second (*dvitīya*) finger,
3 = the middle finger, the third (*tṛtīya*) finger,
4 = the ring finger, the fourth (*caturtha*) finger,
5 = the little finger, the fifth (*pañcama*) or low (*mandra*) finger.

The sign 11, signifying not "eleven" but the figure 1 repeated, is called *kruṣṭa;* due to its infrequency, it is of secondary importance (for the *mudrās* associated with the symbol, see the notes on ML 1.28-31). Likewise, numeral 6, which denotes an "after-sound" *(atisvāra, atisvārya),* is not on a par with the five fundamental numbers. Figure 7 indicates 2 followed by 1 (*abhigīta:* See ML 3.4).

The thumb is "high" and the little finger "low" because of the sitting posture assumed by the chanter: he sits cross-legged with the hand resting, thumb on top, on the right knee. The numbers, then, signify hand postures, which invoke musical phrases and motifs *(svaras).* The reader is reminded that the Vedic *svara* is different from the *svara* of Indian classical music, where the term is used to denote scale degrees (*ṣaḍja, ṛṣabha, gāndhāra,* and so on). In the Sāmaveda a multitude of *svaras* belongs to each of the fundamental numbers *(mudrās);* hence the music that is heard in any given instance depends on the numerical context, the length of the vowel carrying the *svara,* and sometimes the *svara's* position within the chant section *(parvan).* It should be noted that the word *"mudrā"* does not appear a single time in either the ML or its commentary. But the *mudrā/svara* interconnection, which has been a characteristic of the chants from their inception and which has made possible the memorization and oral transmission of the *sāmans* down through the centuries, is so intimate and inseparable that distinguishing between the two was not thought necessary.

Occurring frequently in conjunction with the five basic numbers is the letter *r* (the zero, or *bindu,* is preferred instead in South Indian manuscripts), which designates syllables that are long (*dīrgha*: see ML 1.3 and the notes thereon)—as opposed to prolated (*pluta*) or augmented (*vṛddha*) syllables, that likewise have long vowels but that lack the *r*-notation. According to the Gujarātī Sāmavedīs now residing in Vārāṇasī, appearances of the letter *r* are accompanied by special left-hand *mudrās* (see Howard 1977: 81, Howard 1986: 218).

1r: The little finger of the left hand touches the palm as the thumb of the right hand is held some distance above the forefinger.

2r: The ring finger of the left hand touches the palm as the thumb of the

right hand touches the middle finger.

3r: The middle finger of the left hand touches the palm as the thumb of the right hand touches the middle of the middle finger.

4r: The forefinger of the left hand touches the palm as the thumb of the right hand touches the middle of the ring finger.

5r: The thumb of the left hand touches the forefinger as the fingers close to form a fist; the hand is opened, then closed again. As this movement is executed, the thumb of the right hand touches the middle of the little finger. (Whether this opening and closing action of the left hand occurs with every appearance of 5r, or only in connection with the recurrent phrase

5r r
au ho vā,

I am unable to say at this time.)

The notational figures appear both above and within the text. This trait is apparent in the Grāmageyagāna's opening chant.

```
4        2r  r        1             1            1 r2r
ognāi / ā yāhī3 voitoyā2i / toyā2i / gṛṇāno ha /
   1          1          1 2r  1              1   3
vyadātoyā2i / toyā2i / nāi hotā sā23 / tsā2i bā234
5r  r       3    5
au ho vā / hī234ṣī //
```

It is obvious here that some syllables have numbers placed above while others do not. ML 2.13 makes it clear that a number holds true for all subsequent syllables, until a different number appears. Thus, at the very beginning of the above *sāman*, numeral 4 (that is, the thumb of the right hand touching the middle of the ring finger) is valid for the syllables *o* and *gnāi.* It will be observed that a single line (*daṇḍa*) occurs after these syllables and also in seven other places in the course of the chant. These lines, which are vertical in the manuscripts, demarcate self-contained melodic entities and therefore divide the chant into sections (*parvans*): the above *sāman* is composed of nine *parvans,* but other chants may have more or less. A double *daṇḍa* marks the end of the chant. Within a given section a particular number (*mudrā*) may have influence on the musical realization of a neighbouring number. However, this influence does not extend from one section to another—the 4 on *gnāi,* for instance, has no effect whatsoever on the musical execution of the 2r on *ā,* at the beginning of the second *parvan,* and vice versa.

The numbers that are found within the text itself belong to the syllables that they immediately follow. Many syllables, therefore, are possessed of two or more figures, the number that is notated above and the number or numbers that ensue. In previous publications I have used the term "sequence" to apply to any combination of a superscribed number with one or more numbers in the text itself. Moreover, in writing about the sequences I have used, and shall continue

to use, symbols like 3_{234} to specify particular combinations: in this case numeral 3 above a syllable is followed immediately by 2, 3, and 4 after the syllable (see *parvans* 8 and 9 in the above chant). In this case the thumb touches first the middle of the third finger, then the middle of the index, third, and ring fingers, in that order. Some sequences call for special *mudrās*. The pattern 2_3 (*praṇata*: see ML 3.3-5) of the second *parvan* in the afore-mentioned *sāman* signals the thumb moving from the base of the index finger to the tip of that finger (see Howard 1977: 80, 86). The sequence 1_2 (*karṣaṇa* or *preṅkha*: see ML 1.32) in the second, third, fifth, and sixth *parvans* calls for the thumb to glide over the middle joints of the remaining fingers, from the index finger to the little finger (see Howard 1977: 80, 85). The progression $1_{\dot{2}}$, sung the same as *karṣaṇa* or *preṅkha* in South India, elicits a special *mudrā* in the North: the thumb brushes against the index finger as the hand forms a fist (see Howard 1977: 80, 87). Another special finger movement is that connected with the three *svāra* sequences (1^{111}_{2345}, 2^{111}_{345}, and 3^{111}_{2345})—*svāra* not to be confused with *svara*, the designation for musical sound in general. *Svāra* (see ML 2.1-2) does not appear in the chant under discussion, but it occurs frequently in the Sāmaveda and indicates that the thumb is to pass over the tips of the remaining fingers (see Howard 1977: 80, 86).

The Source Verses

The Sāmavedic paṇḍits not only chant the *sāman*s contained in the *gānas*; they also recite the original verses (*ṛc*s), which are present, as previously noted, in two "collections of *ṛc*" (*ārcikas*): the Pūrvārcika and the Uttarārcika. The Pūrvārcika is the textual source of the chants in the Grāmageyagāna and, along with the appended Āraṇyakasaṃhitā, the Āraṇyakagāna. The Uttarārcika, which repeats many verses from the Pūrvārcika, is the textual well from which the sacrificial chants of the Ūhagāna and the Ūhyagāna are drawn.

Practically all Sāmavedic chants show substantial modifications of the accented source verses on which they are based. For example, the original text of the chant previously under discussion is

1 1 1
agn*a* ā yāhi vītaye gṛṇ*ā*no h*a*vyadātaye /
1 1
ni hotā satsi b*a*rhiṣi //.

The principal accent, the *udātta*, does not have a special accent mark according to the accentuation method shown above, but it is normally preceded by the *anudātta* (marked by a horizontal line beneath a syllable) and followed by the *svarita* (shown by a vertical line above). The accentless syllables (*pracaya*) that often follow the *svarita* are, like *udātta* syllables, left undesignated.

The accentual scheme peculiar to Sāmavedīs of the Kauthuma and Rāṇāyanīya schools uses the figure 1 to designate the *udātta*, 3 to indicate *anudātta*. The *svarita* is specified by 2, but this number denotes *udātta* when an *anudātta* follows immediately. When two or more consecutive *udāttas* occur,

only the first is marked with the 1, while 2r appears with the following *svarita*. *Pracaya* syllables have no markings whatsoever. The *ṛc* quoted above possesses the following figures according to this particular Sāmavedic system.

2 3 1 2 3 1 2 3 2 3 1 2
agna ā yāhi vītaye gṛṇāno havyadātaye /
1 2r 3 1 2
ni hotā satsi barhiṣi //

When this *ṛc* is compared to the above-cited chant, which is based upon it, the following textual differences are noticed.

1) *agna* (originally *agne*) becomes *ognāi.*
2) *ā yāhi* becomes *ā yāhī.*
3) *vītaye* becomes *voitoyāi / toyāi.*
4) *gṛṇāno* remains the same.
5) *havyadātaye* becomes *ha / vyadīoyāi / toyāi.*
6) *ni* becomes *nāi.*
7) *hotā* remains the same.
8) *satsi* becomes *sā / tsāi.*
9) *barhiṣi* becomes *bā au ho vā / hīṣī.*

The interjection *au ho vā* between the syllables of the last word is a *stobha*, an extra-textual addition to a Sāmavedic chant. Interpolations like this are quite common; as stated above, some chants are constituted entirely of *stobhas*. Among the other obvious changes that take place when a verse is converted into a chant are: (1) the replacement of vowels by other vowels, (2) the repetition of words or sections of words, (3) the distribution of a word over two or more *parvans*, and (4) the omission or addition of letters or syllables. These modifications were necessary in adapting the verses to the melodies—a fact which argues strongly for the pre-existence of the melodic fragments that constitute each and every chant.

CHAPTER 1

1. Now henceforth we shall explain the syllabic sounds having the durations short, long, [and] prolated.

Commentary:

The Mātrālakṣaṇa is a supplementary treatise. "That which has the purpose of reporting supplementary teaching" is a supplement. For what [specific] reason is a supplementary work [necessary]? "The Mātrālakṣaṇa is to be addressed [in this regard]." Why [was] this [treatise written]? [That which] follows [should be] called to mind.

> One should employ the *sāman* after knowing the word, the quarter-verse, the division, the time-measure, the meter, the deity, the sage connected with it, and the Brāhmaṇa [text].
>
> That Brāhmaṇ is fit to chant [*sāmans*] who knows the syllables, the pause, the recommencement, and also the sound, the time-measure, and the partitions.

Therefore now that which is addressed [by the Mātrālakṣaṇa]. This is assuredly time measurement and letter duration; thus elaborating on the *prakṛti* [(that is, the Grāmageyagāna and the Āraṇyakagāna)] is not to be discussed. [The formation of the Prakṛtigāna] is [already] spoken of [in other treatises on the Sāmaveda]. [It] is not discussed in the Mātrālakṣaṇa. What, then, [does the treatise address]? In it clear explanation is provided. The introductory [rules are concerned] with the incidence of short [syllables], and so on; and the [duration] of short, long, and prolated syllables is given. From the occurrence of many types of syllables the rationale of temporal relationships is discussed. Endeavouring "to relate explanation of time measure" used to be spoken about. By means of the [typical] case, what is discussed [in the treatise] is precisely that which used to be expressed [in learned discourse]. The entire [Prakṛtigāna] is not [discussed] . . . . "We shall relate [the explanation of topics concerning duration]" is the [stated] goal [of the treatise].

2. In the Sāmavedic chants the one-half and one-quarter durations are found.

Commentary:

With regard to the *sāman* chant, [the chanters] are cognizant of a time value consisting of one-half *mātrā* and [also one of] one-quarter *mātrā*. This we shall explain.

3. A short [syllable is worth] one *mātrā*. A long [syllable is worth] two [*mātrās*.] [A syllable having] triple measure is called "prolated" or "augmented."

4. The wise men used to say [that] a short syllable with two *mātrās*

added is a prolated [syllable]. But a long [syllable] is called "augmented" due to the addition of one *mātrā* [to this syllable].

Commentary:

. . ."Two different ways of measuring time" [and not "two different time values" is to be inferred from the distinction between "prolated" and "augmented"]. In the Sāmarāja [-*sāmans*] there is prolation in the two endings. Similarly in other such cases also [it is seen].

5. One *mātrā* plus one-half *mātrā* is called *adhyardha;* two *mātrās* plus one-half [*mātrā* is called] *ardhatisra;* three *mātrās* plus one-half [*mātrā*] is called *ardhacatasra;* three and one-half *mātrās* [occur] on the *praṇava* [(i.e., on the sacred syllable *ōm)*]; the one-quarter portion of a *mātrā* is called *aṇumātrā.*

Commentary:

[These time values] are to be understood as referring to the *sāman* chant. "We shall explain the syllabic sounds having the durations short, long, [and] prolated." There the three-*mātrā* time value of prolated and augmented [syllables] is stated. "[A syllable having] triple measure is called 'prolated' or 'augmented.'" But where are three and one-half *mātrās* found? On the *praṇava.* *"Aṇumātrā"* is that appellation [that refers to the quarter portion of a *mātrā*].

6. *A, I, U, Ṛ* : These short [vowels] are four [in number].

Commentary:

"These" [is used] for the sake of enumeration. "Exactly these four and no others [are short]." "But wherefore is the validity of the other [vowels]?" From the rest time measure and melody [arise]. In this regard some consider the putting down of [these] durations [in a book]. Then [there are durations] which arise due to irregularity. Of them, moreover, is the one-half *mātrā* value of emitted consonants. One time unit [is characteristic] of the rest. Let [this short time value] not be [confused] with that of the consonants. The appellation "short" is due to the similarity of time. Hence "these" [*(ete)*] is addressed.

7. Those very [vowels] subsequent [to the short vowels, and] in the same [respective] phonetic classes, are long.

Commentary:

In this regard [those] very vowels subsequent to [the short vowels] *a,* and so on, [and] in the same [respective] phonetic classes, are long. The vowels *a* and *ā* alone belong to the same phonetic class. In like manner the succeeding [long vowels] are obtained: *ṝ* [follows] *ṛ,* *ī* [follows] *i,* *ū* [follows] *u.* Thus.

8. Hence the diphthongs also [are long].

दीर्घे वृद्धे चोपधौ गत्याः पृथक्कालः ।।१५।।
उपध्यै

Commentary:

From the vowel *a* the diphthongs appear. They also are long. The existence [of the diphthong] is due to the [prefixed] *a*-vowel. [When] properly uttered it has the apropriate name *"sandhyam"* [(i.e, based on *sandhi,* "euphonic combination," because of its joining of two simple vowels)].

9. [There are] various sounds of the vowels [but] not of the consonant.

Commentary:

Of the vowel *a,* and so on, there are different sounds, [but] not of the consonant.

10. Just the vowel is sounded.

Commentary:

So in the *ārcika* only the vowel is sounded, not the consonant. Or one might say that this is why *svara* [("vowel"="sound")] has its name. "Sound [is obtained] from any of the vowels having the sounded [accent]," it is said.

11. There are three tempi: fast, moderate, slow. In the fast tempo a *mātrā* has three *kalās,* in the moderate four *kalās,* in the slow five *kalās.* The fast [tempo] is red, the moderate dark blue, the slow white.

Commentary:

On account of the difference [of the tempi, they] are performed fast, etc. The colours [associated with the tempi] are said to be red, etc.

12. They are related to the gods. The fast tempo belongs to Vāyu, the moderate to Bṛhaspati, the slow to Sūrya.

13. Among these three [tempi], there is one [and only one] time value of the *mātrā* [in any given tempo].

Commentary:

Of short, long, and augmented [syllables], the duration of a *mātrā* is the time value [associated with] only one among the three tempi.

14. In the *sāman* chants there is melody and evenness of tempo.

Commentary:

[This is] the obligation [of the chanter].

15. There is separate time measurement of *gati* on [its] addition to long and augmented [syllables].

Commentary:

There, on account of *gati*'s dependence upon [a preceding long or augmented syllable, it] is pronounced by means of a letter change. Due to the fitness of pronunciation merely of itself, it is uttered either with long or with augmented [syllables]. [An example of its attachment to a long vowel is found in the extract]

2r r r r 2
au hoyi tvām id dhi havāmahā3̂ e [ĀṛG 14.1: Bṛhat Sāma)].

Likewise, [an example of its attachment to an augmented syllable is found in the excerpt]

4 5 4
āyi punā [(GG 511.5: Aiḍam Āyāsyam),

and] thus elsewhere. There is separate time measurement upon the added pronunciation of *gati* to a long or an augmented [syllable]. On not being uttered [with the vowel that immediately precedes, *gati*] certainly will be like this. In other words, [that which] is uttered [the chanter] says by [speaking] the individual letters one by one. Likewise, a final consonant should not be [considered a part] of *gati*. The consonant and vowels [of a syllable with *gati*] are increased [due to the addition of a final consonant]. The occurrence of two different vowels totalling three *mātrā*s, joined to a [preceding] consonant, is [considered] only one syllable. From [pronunciational] employment [they are thought of as one syllable]. [They are] not separate [syllables]. Hence "separate time measurement" is addressed.

16. A syllable divorced from accentuation has triple measure on every *svara*.

Commentary:

A syllable connected with different *svaras*—*kruṣṭa*, and so on—has triple measure on every *svara*.

17. [The various *svara* combinations are found] in *pratyutkrama*, *atikrama*, *karṣaṇa*, and *svāra*.

18. There are eight types of *pratyutkrama*.

19. In the [number combination] *parisvāra*, the *atisvārya* [*mudrā*] ascends to the low [*mudrā*]. [Instances of *parisvāra* include] *vā* [and] *kāy āsthāirān*.

Commentary:

Within the compass of *parisvāra*, ascent is made to the low [*mudrā*]. [Having] established [the meaning of] *parisvāra*, [the author], at the end of the precept, gives examples of ascent to the low [*mudrā*]. *Pratyutkramas* [involving such ascent] include [passages on the excerpts] *vāyuḥ javāno ho* [and] *vāyor anīke asthiran*.

20. The low [*mudrā* ascends] to the fourth [*mudrā*, as in the excerpts] *śrāyantas, tarobhiḥ,* [and] *puraḥ.*

Commentary:

[Examples of *pratyutkrama* from 5 to 4 include]

5r 5
śrāyanta iva sū4rāyām [(GG 267.1: Śrāyantīyam)],

5 r r 5
tarobhir vo vidā4d vāsūm [(GG 237.4: Dhānākam II), and]

5 r r 5
puŕojitī vo4 'ṃdhāsāḥ [(GG 545.6: Āndhīgavam)].

21. The fourth [*mudrā* ascends] to the third [*mudrā*, as in the excerpts] *dūtam, devo,* [and] *mānā.*

Commentary:

[Examples of *pratyutkrama* from 4 to 3 include]

5r 4
dūtā3ṃ [(GG 12.1: Vaiśvamanasam)],

5r 4
devo3 [(GG 55.1: Draviṇam), and]

5r 4
mānā3 [(GG 128.2: Tānvam II)].

Tā, vo, and *nā:* these syllables [from the above extracts] are illustrations [of *pratyutkrama* from 4 to 3]. Here the *svaras* of the fourth [*mudrā*] ascend to [those of] the third [*mudrā*].

22. The third [*mudrā* ascends] to the second [*mudrā*, as] in [the excerpt] *hīṣī,* and so on.

Commentary:

[An example of *pratyutkrama* from 3 to 2 is]

3 5
hī234ṣī [(GG 1.1: Gautamasya Parkaḥ)].

Here, [on] the utterance *hī,* the third [*mudrā*] ascends to the second [*mudrā*].

23. The second [*mudrā* ascends to] the first [*mudrā*, as] in [the excerpt] *au ho agne.*

Commentary:

In [the excerpt]

2r 2r 1
au holi / agne rāthā23m [(GG 5.2: Śairīṣam)]

the utterance *ho* ascends from the *svara* of the second [*mudrā*] to [that of] the first [*mudrā*].

24. The low [*mudrā*], having passed over the fourth [finger], ascends to the third [*mudrā*, as] in the euphonically joined [extract] *pāvne.*

मन्द्रश्चतुर्थतृतीयावतिक्रम्य द्वितीयं प्रत्युत्क्रामति "षिभाभिप्रि" ।।२५।।

"अश्विनोर्व्रते" साम्नि। अ [ति] क्रमणोदाहरणानि प्रमाणो (प) ज्ञातानि ।।३१।।

Commentary:

Taking euphonic combination [(*sandhi*)] into account,

43r 4 5r r 3r 2 3 5
sunota somapā / āvnā o234 vā [(GG 285.2: Gaurīvitam II)

is an example of *pratyutkrama* from 5 to 3]. Here the utterance *pā* ascends from the low [*mudrā*] to the third [*mudrā*].

25. The low [*mudrā*], having passed over the fourth and third [fingers], ascends to the second [*mudrā*, as in the excerpts] *ṣibha* [and] *bhi pri*.

Commentary:

The low [*mudrā*], having passed over *svaras* of the fourth and third [*mudrās*], ascends to a *svara* of the second [*mudrā*]. The syllable *bhā* [of the extract]

4 5 111
ṣibhā2u / vā345 [(GG 559.2: Yāmam II)

is an example of *pratyutkrama* from 5 to 2]. [In the extract]

4 4 5
e5 / abhi priyā2 [(GG 554.2: Aiḍam Kāvam)]

the utterance *yā* exhibits ascent from the low [*mudrā*] to the second [*mudrā*].

26. The third [*mudrā*], having passed over the second [*mudrā*], ascends to the first [*mudrā*, as] in [the extract] *punānā*.

Commentary:

[An example of *pratyutkrama* from 3 to 1 is the excerpt]

3 2 2
punā31 / nā3ḥ [(GG 511.16)].

This [excerpt occurs] in the Yaudhājaya [-*sāman*].

27. There are four kinds of *atikrama* [("omission"), found in *sāmans* beginning with the words] *mo ṣu tvā, ārohan, yajñā* and so on. [And] in [the first] aśvinor vratam [chant of the āraṇyakagāna] three intervening [*svaras*] are omitted.

28. The *kruṣṭa* [*mudrā*] omits the first [*mudrā* in crossing to the second *mudrā*, as in the extract] *ū na ā gāhī*.

29. The first [*mudrā* omits] the second [*mudrā* in crossing to the third *mudrā*, as in the extract] *ārohān*.

30. The third [*mudrā* omits] the fourth [*mudrā* in crossing to the fifth *mudrā* , as in the extract] *yajñāya*.

31. The first [*mudrā*] omits three [successive *mudrās* in crossing to the fifth *mudrā*, as] in [the first] aśvinor vratam [*sāman*, which has the passage] *ī hī hī hī hī hi*.

पञ्चविधं कर्षणम्। आद्वितीयकर्षणमातृतीयकर्षणमाचतुर्थकर्षणमामन्द्रकर्षणम्। मन्द्रश्चातिस्वार्यात् कृष्यते। "बोधा२" (ग्रा.गा. १.२.१५.१)। "आऽ२३इन्द्रा" (ग्रा. ७.५.२७५.२) "न्माऽ२३४भाइ" (ग्रा.गा. २.८.८७.१)। "ओऽ२३४५इ" (ग्रा.गा. १.१.३.१)। "त्वं न्त्वाऽ६मे" (ग्रा.गा. २.४.४२.२) ।।३२।।

इति मात्रालक्षलणे सविवरणे प्रथमा खण्डिका समाप्ता ।।१।।

★ उद्वया में इत्यत्र उदाहरणं घटते। "मुड्डा" इति उदाहरणं नोपलभ्यते।

Commentary:

Atikrama is of four types. Accordingly, in [the chant beginning] *mo ṣu tvā* the letter *ū* reaches the second [*mudrā*] from the *kruṣṭa* [*mudrā*, as illustrated in the excerpt

11 3 5
ū2̂ / na ā ̂ gā234hī (GG 284.2: Ātram II)].

[In the extract] 1r S 2
āro3hān [(GG 92.1: Ārūḍhavad Āṅgirasaṃ Yāmaṃ Vā)]

the syllable *ro* reaches the third [*mudrā*] from the first [*mudrā*].

[In the extract] 4 3
yajñā5ya [(GG 35.4: Yajñāyajñīyam)]

the syllable *jñā* moves from the third [*mudrā*] to the low [*mudrā*].

"The three intervening [*svaras*" mentioned in rule 27 refers to] the [group of] three *svaras* that comes between [the *svaras* of the first and fifth *mudrās*]. For instance, [this occurs] in the [first] Aśvinor Vratam chant, [in the extract

1 1 2r 3r 2
ī5 hī hī hī hī hi (ĀrG 103.1].

The [above] examples of omitting [*mudrās*/*svaras*] were discovered through authoritative perception.

32. There are five kinds of *karṣaṇa*: [they are] *karṣaṇa* to the [*svaras* of the] second, third, fourth, and low [*mudrās*]; also, [a *svara* of] the low [*mudrā*] is extended on account of the *atisvāra* [*mudrā*]. [Examples of the five cases are] *bodhā, āindrāḥ, nmābhāi, oi,* [and] *tvan tvām e.*

Commentary:

[The statement] "also, [a *svara* of] the low [*mudrā*] is extended on account of the *atisvārya* [*mudrā*" needs clarification]. It is extended as long as [that nasalization] on the *atisvāra* [*mudrā*]. On reflection, moreover, it will be [performed] exactly in this manner. [There is no *karṣaṇa*] of the remaining *svara* [(that is, of the *atisvārya*)] due to the absence of a subsequent lower [*mudrā*]. [Its] mere existence is immutable. Of the other *svaras*, it is shown [that] *karṣaṇa* is found on all [of these] *svaras*. For instance, in the [first] Jarābodh [īyam chant]:

1
bodhā2 [(GG 15.1)];

[in the second Kāvaṣam chant]: 1 2
ā23indrāḥ [(GG 275.2)];

in the Viśoviśīyam: 1
nmā234bhāi [(GG 87.1)];

[in the chant beginning with the words] *agniṃ dūtam*:

1
o2345i [(GG 3.1: Bṛhad Bhāradvājam)];

[in the Gautamam]: 5 5
tvan tvā6m e [(GG 42.2)].

CHAPTER 2

1. There are three types of *svāra* [("having musical sound"): those] beginning with the first, second, and third [numerals].

2. [That] beginning with the first [numeral] has a duration of nine [*mātrās*]. [That] beginning with the second [numeral] has a duration of six [*mātrās*]. [That] beginning with the third [numeral] has a duration of eight [*mātrās*]. [Examples of the three types are] *hariśrīḥ*, *rayim*, [and] *ī*.

Commentary:

Hariśrīḥ: this [example of *svāra*] has a duration of nine [*mātrās*]. *Rayim*: this [example of *svāra*] has a duration of six [*mātrās*]. The *nidhana*

3 111
ī2345

of the [Mahā]vairājam [chant] has a duration of eight [*mātrās*].

3. When [a syllable] with *svaras* [of the] low, second, or third [*mudrās*] ascends, without *karṣaṇa* [(that is, without an intervening *mudrā*)], to the next higher [*mudrā*], then the first [*svara*] is worth two *mātrās*.

Commentary:

"A syllable divorced from accentuation has triple measure on every *svara*" [(ML 1.16)]. Therefore, this is an exception to the preceding rule. A word syllable with *svaras* [of the] low, second, and third [*mudrās*] proceeds upwards, moving without *karṣaṇa*. [Proceeding] immediately to the *svara* [of the] next higher [*mudrā*, the syllable] begins with a two-*mātrā* [*svara*].

4. For example, on *śrayantas*, *tarobhiḥ*, *puro*, the beginning of *hiṣī*, the *vairājanidhana*, and *au ho agne*.

Commentary:

For the sake of illustration, examples are found there:
for instance,

5r 5
śrāyanta iva sū4rāyām [(GG 267.1: Śrāyantīyam)],

5 r r 5
tarobhir vo vidā4d vāsūm [(GG 237.4: Dhānākam II), and]

5 r r 5
purojitī vo4 'ṃdhāsāḥ [(GG 545.6: Āndhīgavam)].

The beginning of *hiṣī* [(GG 1.1: Gautamasya Parkaḥ)] is worth two *mātrās*, [as

न- घ्नतावामा गायत्रे चावनर्दे ।।५।।

"यन्मन्द्रद्वितीयतृतीयैः स्वरैः" (मा.ल. २.३) इति सिद्धस्य प्रतिप्रसवः "घ्नता ३४ वामा २" (ग्रा.गा. ८.८.३०५.१)। "अभि देवाँ ्इया २२१२" (अ.गा.प्रा. ११) ।।५।।

प्रतिसतः

पाव्ने द्विमात्रौ मन्द्रतृतीयौ ।।६।।

"सुनोत सोमपा०ना" (ग्रा.गा. ८.६.२८५.२)।अत्र [संधिवत्] कृत्वा शाखान्तरीयस्योदाहरणम् ।।६।।

सत्वं नं

ह्रस्वो मन्द्रो-अच्छा उ वा याम् ।।७।।

मन्द्रो ह्रस्वो

अच्छा२उ वा३४५। विस्वरमक्षरमिति प्राप्तस्य प्रतिषेधः। "अच्छा उवा" मिति मृजन्ति ।।७।।

अच्छा मृजन्ति

दीर्घकर्षणे द्विमात्रौ प्रथमद्वितीयौ — प्रप्रा ।।८।।

प्रथमद्वितीयौ स्वरौ दीर्घौ भवतः। "प्र प्रार्वयम्" (ग्रा.गा. १.४.३४.१) ।।८।।

द्वितीयतृतीयौ च — भरतायत्सोमे; नर्यो३ ।।९।।

"भरता३यत्सोमे३" (ग्रा.गा. ५.८.१८८.१)। "नर्यो३" (ग्रा.गा. १४.५.५१२.२)।। द्वितीयतृतीययोश्च स्वरयोर्यद् दीर्घकर्षणं तस्मिंश्च तौ द्वितीयतृतीयौ स्वरौ [भवतः] ।।९।।

is the beginning of *ho* in *au hoi agne rāthām*] [(GG 5.2: Śairīṣam)]. On the *vairājanidhana* the vowel *ī* [begins with a two-*mātrā svara*]. [In]

2r 2r 1
au holi / agne rāthā23m [(GG 5.2: Śairīṣam)
the syllable *ho* begins with a two-*mātrā* svara].

5. [The rule is] not [valid in the passage] *ghnatāvām ā* and in the *avanarda*[*na*] of the gāyatram.

Commentary:

[The rule beginning] "when [a syllable] with *svaras* [of the] low, second, or third [*mudrā*s" (ML 2.3)] is not applicable [to]

3 2 3'r . 2
ghnatā34vām āl [(GG 305.1: Aśvinoḥ Saṃyojanam)].

[Neither is it applicable to]

2 1 r r 2
abhi devām̐ iyā1212 [(Gāyatram: from the *retasyā* or "semen" verse of the *bahiṣpavamānastuti*)].

6. On *pāvne* [the *svaras* of] the low and third [*mudrās*] are worth two *mātrās* each.

Commentary:

[In the extract

43r 4 5r r 3r 2
sunota somapā / āvnā [(GG 285.2: Gaurīvitam II)]

the syllable *pā* is split between two *parvans*]. Carrying out euphonic combination here is a characteristic of another Vedic school.

7. [In the excerpt] *accha u vā* the low [*mudrā*] is short.

Commentary:

This [too] is an exception to the rule "a syllable divorced from accentuation [has triple measure on every *svara*]." [The passage in question] is *accha u vā*.

8. In *dīrghakarṣaṇa* [("extension of a long [syllable]")] both the first and second [*mudrās* have *svaras*] worth two *mātrās* each, [as in the excerpt] *praprā*.

Commentary:

The *svaras* [of the] first and second [*mudrās*] are long. [An example of this is the extract] *praprā vayam*.

9. [In *dīrghakarṣaṇa*] both the second and third [*mudrās*] also [have *svaras* worth two *mātrās* apiece, as in the excerpts] *bharatā*, *yat some*, [and] *naryo*.

Commentary:

[Examples of this are]

1 2r
bharatā3 [(GG 98.2: Prahitaḥ II)],

स्वारे त्रयोऽन्त्याः पृथगेकमात्राः ।।१०।।

स्वारे त्रयः स्वराः [द्वि] तीयादयः पृथगेकमात्रा भवन्ति ।।१०।।
स्वारौ त्रयः स्वरातीयादयः

सुवितऽ३म्। यस्यको ना" (ग्रा.गा. ८.९.३१६.२)। "तुरयऽ१।तो हविन्ता इ" (ग्रा.गा. ९.११.३३७.१)। "सहस्त्रधारर२म्" (ग्रा.गा. १७.११.५८१.६) इति ।।११।।

त्रिविधोद्घातो — व्यदा-मतौ-ऋचौ हो-प्रभृतीनि ।।१२।।

उद्घातः त्रिप्रकारो भवति। "व्यदातोयाऽ२इ" (ग्रा.गा. १.१.१.१); "मतौऽ२हुवाइ" (ग्रा.गा. ३.२.१२८.२) "ऋचौऽ२हो" (ग्रा.गा. ३.५.४८.२) ।।१२।।

पञ्चस्वरैर्युक्तं धार्यम्। "गृणानोह" (ग्रा.गा. १.१.१.३); "द्रविणस्युर्विपन्यया२" (ग्रा.गा. १.१.४.२); "विपां ज्योताइ" (ग्रा.गा. ३.११.९८.१); "आदित् प्रत्नाऽ५स्य रेतसाः" (ग्रा.गा. १.२.२०.१); "अग्निं वो वृधान्ताम्" (ग्रा.गा. १.३.२१.१) ।।१३।।

[पञ्चस्वरैः] संयुक्तं धार्यम्। गृणानो ह। अत्र णकारो धार्यः प्रथमस्वरे। द्रविणस्युर्विपन्यया। अत्र विशब्द-णशब्दौ धार्यौ द्वितीयस्वरे। विपां ज्योता३यि। अत्र ज्योशब्दः तृतीयस्वरे। "आदित्प्रत्नास्यरेतसा" इति दित्प्र [ौ] धार्यौ चतुर्थस्वरे। अग्निं वो वृधांताम्। अत्र वोवृधा इत्येतानि त्रीणि मन्द्रस्वरे। एवमादि सर्वत्र द्रष्टव्यम् ।।१३।।

2 r r
yat some3 [(GG 188.1: Vaitahavyam), and]
2 r
naryo3 [(GG 512.13: Guddaḥ)].

Also, when there is *dīrghakarṣaṇa* of the *svara*s of the second and third [*mudrā*s], these *svara*s [are worth two *mātrā*s each].

10. On *svāra* [syllables] the last three [numbers] are worth one *mātrā* each.

Commentary:

On *svāra* [syllables] three *svara*s, beginning with [that of] the third [numeral], are worth one *mātrā* each.

11. In *hrasvakarṣaṇa* [("extension of a short [syllable]")] each of the two *svaras* has one *mātrā*, [as in the excerpts] *suvitam, turaya*, [and] *sahasradhāram*.

Commentary:

[Examples of *hrasvakarṣaṇa* are]

2
suvita3m [(GG 316.2: Partham II)],
2
turaya3 [(GG 337.1: Gṛtsamadasya Madaḥ I), and]
2 1 r
sahasradhāra2m [(GG 581.6: Kaulmalabarhiṣīyam III)].

12. There are three types of elevation, [as in the extracts] *vyadā, matau, ṛcau ho*, and so on.

Commentary:

Elevation is of three kinds. [Examples are]

2 1
vyadātoyā2i [(GG 1.1: Gautamasya Parkaḥ)],
21 1
matau2 / huvāi [(GG 128.2: Tānvam II), and]
2 2
ṛcau3 ho [(GG 48.2: Bārhaduktam II)].

13. A regular [tonal] succession is to be maintained by means of the *svaras* of the five [*mudrās*]. [Examples of this continuity of *svara* are] *gṛṇāno ha, draviṇasyur vipanyayā, vipāṃ jyotāi, ād it pratnāsya retasāḥ*, [and] *agniṃ vo vṛdhāntām*.

Commentary:

(With the *svara*s of the five *mudrā*s] continuity [of *svara*] is to be maintained.

सप्तविधार्धमात्रा। ''ओ ग्ना इ'' (ग्रा.गा. १.१.१.१); ''प्रेष्ठं वो हाउ'' (ग्रा.गा. १.१.५.३); षु प्रावोऽ२३चाऽ३४३:'' (ग्रा.गा. १.३.२८.१); नायक्रमीऽ२त्। वो अग्नायारेइ'' (ग्रा.गा. १.४.३५.१); ''तियाइ३ञ्जाँ५रा६५६न्'' (ग्रा.गा. २.७.६४.१); ''विशो विशो हुम् स्थि वो ६ अतिथाइम्'' (ग्रा.गा. २.९.८७.१)

इमाः सप्त अर्धमात्रा प्रकारा भवन्ति। यथोदाहृताः ।।१४।।

प्रकारो भवति

इति मात्रालक्षणे विवरणसमन्विते द्वितीया खण्डिका ।।२।।

In *gṛṇāno ha* the syllable *ṇā* is maintained on a *svara* of the first [*mudrā*]. In *draviṇasyur vipanyayā* the syllables *vi* and *ṇa* are kept on a *svara* of the second [*mudrā*]. In *vipāṃ jyotāi* the syllable *jyo* is on a *svara* of the third [*mudrā*]. [In] *ādit pratnāsya retasāḥ* [the syllables] *°d it* and *pra* remain on the *svara* of the fourth [*mudrā*]. In *agniṃ vo vṛdhāntām* the three [syllables] *vo vṛdhā* [(?—*gniṃ vo vṛ*?) remain] on the *svara* of the low [*mudrā*]. In this manner one should discover [the appropriate *svara/mudrā*] everywhere.

14. [There are] seven ways [in which] the one-half *mātrā* [time value occurs]. [Examples are] *ognāi, preṣṭhaṃ vo hāu, ṣu prāvocāḥ, ṇāy akramīt, vo agnayāi, tiyāṃ cārān,* [and] *viśo viśo hum vo atithāim.*

Commentary:

These are seven contexts of the one-half *mātrā* [duration]. They are illustrated accordingly [(but see the ensuing notes for the notation)].

CHAPTER 3

1. There are two types of *gati, i-gati* and *u-gati.* [The two types consist of] glottal-labial and glottal-palatal [vowel combinations].

Commentary:

Gati is of two kinds. [The vowel combination] *āu* [involves] glottal and labial [sounds, whereas] *āi* [combines] glottal and palatal [sounds].

2. There is *mātrā* measurement of the two [types]. [*Gati* is worth either] one or one-half *mātrā*: thus says Gārgya, the learned teacher. In the *sāman* chant six *mātrā* [measurements] are realized: one, two, three, one-half, one and one-half, and one-quarter *mātrās*. The learned man [(*ācārya*)] is the one who brings this about; and it is the Sāmavedic chanter who distinguishes one *svara* from another. [He] conceals the eighteen transgressions of *svara.*

Commentary:

[Syllables] having the addition of *gati* are not of the same duration. Why, then, [is this so]? [*Gati*] is [measured] separately. "On [its] addition to long and augmented [syllables" (ML 1.15)] has [previously] been spoken of here. Therefore, the option "one-half *mātra* or one *mātrā*" is put forth. [*Gati* introduced by a semivowel, which occurs] between the vowels of [syllables having such] additions, has a time value of one *mātrā*, [as is the case with the] *gati* accompanying *ā yāhī voyi* [(GG 1.1)]. [The semivowel has a specific duration] due to [its] pronunciation between letters. Like a consonant, [it is worth] one-half *mātrā*: thus [the one-*mātrā*] option [for *gati*]. Moreover, it is considered [the duration] of the other consonant [(that is, the consonant that begins the syllable)]. Wherever a consonant is utilized, the one-half *mātrā* [duration results]. Accordingly, to prevent jumping over to the vowel *i* from [a preceding vowel, the letter *y*, lasting] one-half *mātrā*, [is inserted] here.

3. The time value of *ārcika* syllables [is also that] of the *svarita* [accent], *vinata* [("downwardly inclined")], *praṇata* [("respectfully saluted," "bowed in reverence")], *utsvarita* [("sounded from afar," "sounded upwards")], and *abhigīta* [("sung out, to, or over"?)].

Commentary:

On account of tempo [(rhythm?)] there are apprehensions [connected with]

प्रणतोदाहरणानि — आयाहि, तिग्मेन, रम्मन्ये, ओषधीनाम् — (शुक्रियेषु) इत्येतानि दत्तानि।

employing the *svarita* [accent]. "One should perform [syllables that are] not long like [those that] are," it is said. "Because of that [very circumstance] on *svarita* [syllables, this accent], therefore, should turn out exactly as just stated [in the previous sentence] as far as time measurement is concerned [(i.e., short syllables should possess the value of long syllables)]." However, on the remaining [accents the Brāhmaṇs] definitely recite [rather than chant]. The time value of *ārcika* syllables is [also that] of *vinata, praṇata, utsvarita,* and *abhigīta.* It is not the "syllable divorced from accent" [(ML 1.16)] that is furnished with this [time value].

4. **Vinata begins with the first [finger] and ends with the second [finger]. *Praṇata* begins with the second [finger] and ends with the third [finger]. *Utsvarita* begins with the fourth [finger] and ends with the low [finger]. *Abhigīta* begins with the second [finger] and ends with the first [finger].**

Commentary:

Vinata begins with a *svara* of the first [finger] and concludes with a *svara* of the second [finger]. Beginning with a *svara* of the second [finger] and ending with a *svara* of the third [finger] is *praṇata.* Beginning with a *svara* of the fourth [finger] and ending with a *svara* of the low [finger is *utsvarita*]. *Abhigīta* begins with a *svara* of the second [finger] and ends with a *svara* of the first [finger].

5. **One-half *mātrā* occurs with the low *svara* at the end of *vinata* and *praṇata.* One and one-half [*mātrā* is found] on the high [*svara*]. [This occurs] on a long [syllable]: on a short [syllable the high *svara* is worth] one-half [*mātrā*]. [An example is] *yaṃ yaṃ yaṃ yām.* In the rahasyagāna [these time values occur] many times. The two saṃmīlyam [*sāmans*], *pibā somam, abhī navante, ud u brahmāṇi, indrasya nu vīryāṇi,* the kaśyapapuc-cham, the mahādivākīrtyam, the *ānandaḥ, ā yāhi, tigme, ram manye,* [and] *oṣadhīnām* in the *śukriyas* [also have examples].**

Commentary:

One-half *mātrā* is found with the low *svara* at the end of *vinata* and *praṇata.* One and one-half *mātrā* is found on the high *svara.* Therefore [what is] stated is a deduction. *Vinata* [begins with the first finger] and concludes with the second [finger]. "*Praṇata* begins with the second [finger] and ends with the third [finger" (ML 3.4)]. One and one-half [*mātrā*] occurs on the upper *svara* of both *vinata* and *praṇata.* [This takes place] on a long syllable. But on a short syllable one-half *mātrā* occurs on that very upper *svara.* [The extract]

2 1 ऽ 1
yaṃ yaṃ ya2ṃ yām [(GG 337.2: Gṛtsamadasya Madaḥ II),
from a *sāman* on the *ṛc* beginning] *yaṃ vṛtreṣu,* is an example of *vinata.* In the

2 1ऽ 1S 1 2 1r r
indra2m / indra2m / indram / indro vā [(ĀrG 114.2: Vasiṣṭhavratam II)].

[The *stobha*]

1rऽr 1rऽr
aihī2 aihī2 [(ĀrG 147.1)]

is scattered throughout the Kaśyapapuccham [The excerpt]

2 1 ऽ 1 ऽ 1
haṁ vam va2m vam va2m vam [(ĀrG *stobha*, after 155.1:6)

occurs] in the Mahādivākīrtyam and in the Tavaśyāvīyam [(ĀrGP)].
[The extract]

1 ऽ 1 ऽ
uvi2 uvi2 [(ĀrG 160.1)

is found] in the Ānandaḥ. . . . .

6. On *utsvarita* [syllables] one-half *mātrā* [occurs] on the fourth [*mudrā*]. One and one-half [*mātrā* is found] on the low [*mudrā*]. [Examples are] *manuṣyebhiḥ* and *ka īṃ vyaktāḥ*.

Commentary:

[Examples of *utsvarita* are]

5 4r 4
manuṣye5bhir agniḥ [GG 79.1: Prāsāham) and]
4 5r 4. 4
ka īṃ vya5ktāḥ [(GG 433.1: Hikam)].

On *utsvarita* [syllables] one-half *mātrā* occurs on the *svara* of the fourth [*mudrā*]. One and one-half [*mātrā* occurs] on the low [*mudrā*]. [An example] is *manuṣyebhiḥ*. But because this [example has] "the time value of an *ārcika* syllable," for that very reason [this measurement] will not be found on *ka īṃ vyaktāḥ*. But for what reason is the exception stated? These very two [examples] with *utsvarita* are found [here] just for the sake of enumerating *utsvarita* [types]. On the other hand, because of being uttered here "like the *svara* of [the source] *ṛc*," [*utsvarita* has the characteristic] "high with the high, low with the low." Elsewhere also this is generally [true]. The former [types are so named] "because of a connection with the *svarita* [accent]," but not *ka īṃ vyaktāḥ*. [The extracts] *manuṣyebhiḥ* [and] *ka īṃ vyaktāḥ* [show two *utsvarita* varieties].

7. On *abhigīta* [syllables] one-half *mātrā* is found on the second [*mudrā*], one and one-half [*mātrā*] on the first [*mudrā*]. [Examples are] *stomaṃ rudrā* [and] *arkaiḥ*.

Commentary:

One-half *mātrā* is found on *abhigīta* [syllables]. [This value occurs] on the second [*mudrā*]. [This is true] on either long or short [vowels, as in] *stomaṁ rudrā* [and] *apinvo arkaiḥ*. Thus the reading: on both kinds of *abhigīta* one-half *mātrā* is found on the second *svara*. On the first, one and one-half occurs. On long and short [vowels, the time value] of one and one-half *mātrā* occurs on the first: *stomaṁ rudrā* [has] the short [vowel], *janayaṃt sūryam api* the long.

8. One-half *mātrā* is found with the low *svara* at the beginning of *abhigītakṛṣṭa*. Two and one-half [*mātrā*]s occur on the high [*svara*]. [Examples are] *to dhva* [and] *to kṣa*.

Commentary:

That which is drawn from the *abhigīta* is *abhigītakṛṣṭa*. One-half *mātrā* by measure is connected with the low *svara* at the beginning of *abhigītakṛṣṭa*. The inference stated here is "*abhigīta* beginning with the second [*svara*]." Two and one-half *mātrā*s occur on the first [*svara*]. On the other hand, others teach "a three-*mātrā* first [*svara*]." [This] is prescribed for the sake of removing uncertainty—[for instance, in the extract] *indraṃ vṛdhānte*.

9. Final *y* amounts to one-quarter [*mātrā*, as in] *rāyāy*. Initial *ṛ* is worth one-quarter *mātrā*. The letter *r* is worth one-half *mātrā*. *Svarabhakti* supplied in the middle [of a word] is worth one-half *mātrā*. Also [that] standing joined [through *sandhi* is worth one-half *mātrā*]. It increases [the duration], "although not [through] vowel modification." In the conjunction of *h*, *r*, and a sibilant, the *svarabhakti* followed by [(or following] *r* [amounts to] one *mātrā* [(?), while] the complete time value of one and one-quarter *mātrās* [holds for the two sounds combined].

Commentary:

. . . The beginning of *ṛ* is discarded. One-quarter *mātrā* is uttered with [*ṛ* as] the initial vowel. Only on it [(i.e., the one-quarter *mātrā*)] is the *svara* of *ṛ* present, at the end. [It is] like a leaf-worm, [which munches on the ends of the leaves]. However, this [one-quarter *mātrā*] duration is not associated with a consonant [in conjunction] with an *r*, [which occurs, for instance,] in the middle of the syllable *krā*. [It is associated] with the initial vowel, on account of [its] being of a different species [of sound]. Due to being a consonant, [as in] *rauhyam*, modification in the sound [of the letter *r* arises] only from euphonic combination. [This] is spoken of in another *śāstra* [(see Ml 1.9-10)]. "[Musical] sounds do not occur in connection with a consonant." Hence this measuring of it [relates to] Sāmavedic vowel separation [(*svarabhakti*)]. [Musical] sound occurs on the eleven vowels. The [vowel] sound following the letter *r* is a remnant. It is similar

प्रतिज्ञा खलु वर्तते। प्रतिज्ञा खलु वर्तते ।।१०।।

प्रतिज्ञामात्रा जानिहितम्। तथोक्तं शास्त्रान्तरेऽपि। तत्पुनरिदमवशिष्टम्। विश्वावस्वादयश्च गन्धर्वाः सामस्तु (सु ?) निभृतं करणं स्वरसौक्ष्मात्तेऽपि हि न कुर्युः ।।१०।।

इति मात्रालक्षणे विवरसमन्विते तृतीया खण्डिका समाप्ता ।।३।।

।। मात्रालक्षणं समाप्तम् ।।

to and coalescent with, the preceding vowel. Moreover, this [following sound] is worth one-half *mātrā*. Its purpose is elision. "[Musical] sounds do not occur in connection with consonants." Therefore *y* also, having a fractional duration, creates a surplus. [This results] from measuring the [letters of the] alphabet. Because the *mātrā* [measurement] assigns durations to the remnants, indicating *mātrā* is useful only in promoting the intended goal: [namely], the description of *svara*. The *ṛ* portion, measured by a fraction, has one-quarter *mātrā*. The [letter] *r* located in the middle of the syllable *krā* is not worth one-half *mātrā*. *Svarabhakti* resulting from the purposeful change [of final *s* to *r*] does not amount to one-half [*mātrā*]. In this instance, accordingly, duration results from euphonic combination [(i.e., the substitution of *r* for *s*); likewise], in [cases like] *ayavāy* the *i*-element of the diphthongs changes into *y* [when a vowel follows]. The prevailing rule is that fixed *y* is worth one-half *mātrā*. [A case like] *indrād-radāḥ*, in which trembling [is elicited, has a measurement that] amounts to one *mātrā* plus one-half *mātrā* [and] one *mātrā* [(?)] plus one-quarter *mātrā* on the beginning [letters]. Time measure is not capable of being effected [in such a case].

10. The proposition indeed is fulfilled: the proposition indeed is fulfilled.

Commentary:

The proposed statement about *mātrā* is brought to fruition. [It is] thus put forth in the very remainder of the treatise. Apart from this the following remains [to be said]: the gandharvas Viśvāvasu and so on [sought to learn] the secret time calculation present in the Sāmavedic chants; [but], due to the subtlety of *svara*, even they would not accomplish [this].

[The section of the commentary given below is found in some manuscripts and Dr. B.R. Sharma has inserted them in his edition just after Sutra-9. Since it does not go with the ninth Sutra and is rather corrupt, it has been omitted in the text. Obviously the Sutra with which this commentary should have given is itself missing in the extent manuscripts.]

NOTES

CHAPTER 1

1

The ML concerns itself solely with the time measurement of musical sound *(svara).* It does not address chant construction, which is the subject of other treatises on the Sāmaveda (the Pañcavidhasūtra, for instance). The chant extracts used for illustrative purposes by the ML and its commentator are drawn from the Prakṛtigāna (the GG and the ĀrG). Only typical cases are put forth. In other words, when discussing the number sequence *utsvarita* the ML cites two examples from the Prakṛtigāna. It does not list all examples of *utsvarita* that are found in the two songbooks.

3

A. *Short Syllables*

The rule stating that syllables with short vowels are worth one *mātrā* is valid only where conjunct consonants do not follow. The T chanters increase this value to one and one-half or two *mātrās* before conjuncts and/or differently notated syllables. This modification takes place regardless of the numerical context. The T treatment of syllables with and without the ensuing conjuncts is obvious in this and the following excerpts.

Example 1 (T). 1 *mātrā* = eighth note. Gāyatram.

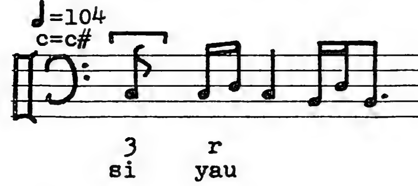

Note that here the first and fourth syllables contain one and one-half instead of two *mātrās*. However, on the segmented beam I have given them two *mātrās*, which may or may not be the intended duration.

Example 2 (T). 1 *mātrā* = sixteenth note. Mahāvaiśvāmitram I (GG 343.6).

The 2 notation on the last syllable of Example 2 appears to be an outwards indication that three *mātrās* are found here : see Example 16 for an instance of 2̂ on a short vowel.

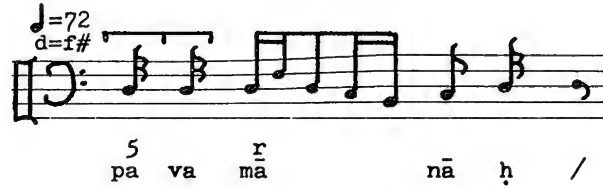

Example 3 (T). 1 *mātrā* = eighth note. Vāmadevyam (ŪG 1.1.5).

Example 4 (T). 1 *mātrā* = sixteenth note. Hārivarṇam I (GG 383.1).

Example 5 (T). 1 *mātrā* = sixteenth note. Janitram II (GG 484.2).

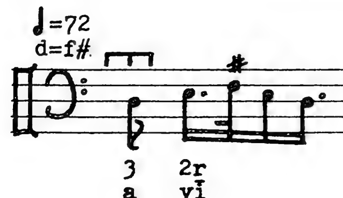

Notice also that a change of notation affects a preceding short syllable similarly, thus increasing its duration to two *mātrās* in these T renditions.

Example 6 (T). 1 *mātrā* = eighth note. Bārhaspatyam (GG 91.1).

Example 7 (T). 1 *mātrā* = sixteenth note. Mahāvaiśvāmitram I (GG 343.6).

Example 8 (T). 1 *mātrā* = sixteenth note. Sāṃvargaḥ (GG 11.1).

Example 9 (T). 1 *mātrā* = eighth note. Āmahīyavam (ŪG 1.1.1).

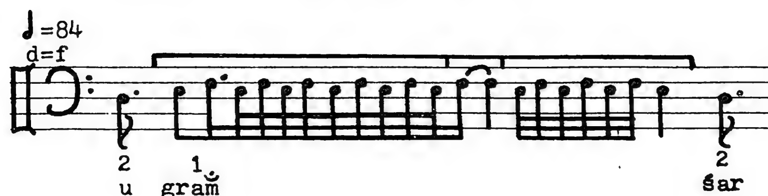

The NK Sāmavedīs are inconsistent, sometimes doubling when conjucts or differently notated syllables follow, sometimes not. Their ambivalence is reflected in this extract, where the *mātrā*'s value changes from an eighth note, as on the first syllable, to a sixteenth note on the remaining syllables with short vowels.
Example 10 (NK). 1 *mātrā* = eighth note. Gāyatram.

It is worth noting that the Kauthumas of North India (Gujarāt/Vārāṇasī) assign one *mātrā* to each syllable with a short vowel, irrespective of the presence of conjuncts (see Howard 1986: 335).

When 1-notated short syllables are closed by *anunāsika (m̐)* both the T and NK singers extend them even beyond the value of a prolated syllable, although a tripartite division can be hypothesized.
Example 11 (T). 1 *mātrā* = eighth note. Āmahīyavam (ŪG 1.1.1).

Example 12 (NK). 1 *mātrā* = sixteenth note. Āmahīyavam (ŪG 1.1.1).

The T chanters extend the 1-notated *stobha* syllable *him* (or *hum*) to six *mātrās* in this performance; however, the threefold division characteristic of prolated/augmented syllables is evident here as well.

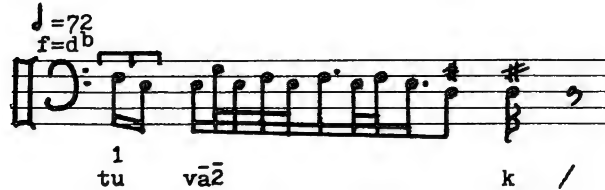

Example 13 (T). 1 *mātrā*=eighth note. Gāyatram.

This *stobha* is not accorded any special treatment in Karnataka. In some manuscripts and prints this syllable is followed by the abbreviation *sthi* (for *sthiramātrā*), which indicates that a pause lasting one-half *mātrā* is to be made after *him* (see ML 2.14).

As is the case in Vārāṇasī (see Howard 1986: 337), the T singers sometimes extend the duration of short 1-notated syllables before the number sequences 21 *(pratyutkrama)*, 1$\bar{2}$ *(preṅkha)*, and 1SR2 *(vinata)*; they may shorten the duration before the sequence 123 *(karṣaṇa)*. See the Introduction for an explanation of this type of number symbolism.

Example 14 (T). 1 *mātrā* = sixteenth note. Vāco Vratam I (ĀrG *Stobha*, before 94.1).

Example 15 (T). 1 *mātrā* = eighth note. Āmahīyavam (ŪG 1.1.1).

The NK Rāṇāyanīyas are inconsistent in observing this guideline.

According to NK practice, short syllables designated 2 are held far beyond their ordinary duration: ten *mātrās* resulted in the following performance, although an overall division into only three *mātrās* may be intended in theory—this is the practice in Vārāṇasī (see Howard 1986: 338).

Example 16 (NK). 1 *mātrā*=sixteenth note. Sāṃvargaḥ (GG 11.1).

Not enough specimens were provided to permit conclusions on T treatment.

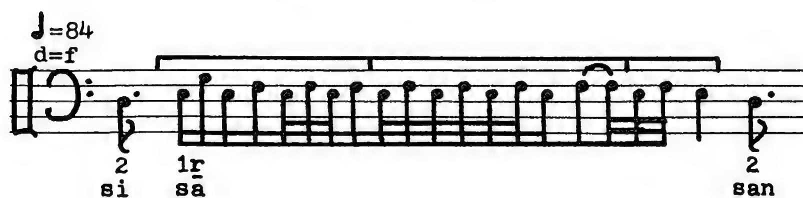

B. *Long Syllables*

In the chantbooks long syllables are those with long vowels having the letter *r* placed above. Prolated and augmented syllables have long vowels that lack this notation.

1r

In both the T and NK traditions a 1r-notated syllable either final in the *parvan* or followed by a differently notated syllable often has more than four times the duration of a two-*mātrā* syllable, as this T excerpt demonstrates. The three divisions that one would expect of prolated/augmented syllables are present.

Example 17 (T). 1 *mātrā*=eighth note. Āmahīyavam (ŪG 1.1.1).

In the T style a single 1r syllable in a series of 1-notated syllables is worth two *mātrās* if it is the first syllable in the series and if prolated/augmented 1 follows at some point in the series. If it is not first in the series, it has the three divisions characteristic of prolated/augmented syllables (see Example 17).

Example 18 (T). 1 *mātrā*=sixteenth note. Hārivarṇam I (GG 383. 1).

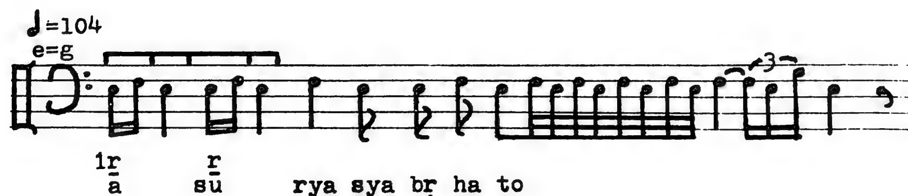

The NK chanters may extend the duration of 1r syllables to from six to eight *mātrās* if these syllables occur in a series and are followed at some point by prolated/augmented 1. Notice, however, that the change of pitch divides each syllable into two unequal segments.
Example 19 (NK). 1 *mātrā*=eighth note. Gāyatram.

In the T tradition the second of two consecutive 1r syllables in a series of 1-notated syllables is treated as a prolated/augmented syllable, and thus is prolonged to six or more *mātrās*, but with the anticipated three divisions, if (a) it is not followed, at some point in the series, by prolated/augmented 1, or (b) the sequence *vinata* does not occur after the series. The other 1r syllable is comprised of the expected two units.
Example 20 (T). 1 *mātrā*=sixteenth note. Gautamasya Caiva Parkaḥ (GG 1.3).

Two consecutive 1r syllables in a series of 1-notated syllables are worth two or three *mātrās* each if prolated/augmented 1 follows at some point in the series or if *vinata* occurs after the series. Each syllable is comprised of two clearly defined segments, however.
Example 21 (T). 1 *mātrā*=eighth note. Kāvam (ŪG 1.1.13).

Two non-consecutive 1r syllables in a series of 1-notated syllables are comprised of two *mātrās* each.
Example 22. (T). 1 *mātrā*=sixteenth note. Rayiṣṭham (GG 512. 2).

♩=72
d=f#

2 1r r
su ṣā va so ma ma dri

The last of three (or more?) 1r syllables in a series of 1-notated syllables is extended to from four to six *mātrā*s, with the three divisions characteristic of prolated/augmented syllables, if prolated/augmented 1 does not follow in the series (or if *vinata* does not follow the series?). The other two 1r syllables are worth two *mātrā*s each.

Example 23 (T). 1 *mātrā*=sixteenth note. Kaśyapasya Barhiṣīyam (GG 1.2).

♩=72
e=g#

1 r r r
gṛ ṇā no ha vya dā tā23

The last of three (or more?) 1r syllables in a series of 1-notated syllables does not undergo such extension if prolated/augmented 1 follows in the series (or if *vinata* occurs after the series?). It and the preceding 1r syllables are held for two *mātrā*s.

Example 24 (T). 1 *mātrā*=eighth note. Gāyatram.

♩=104
f=a♭

1r r r
rgo de va sya dhī mā

In the NK tradition a single 1r or the last in a series of 1r syllables is prolonged to approximately six or seven *mātrā*s, with the division reminiscent of prolated/augmented syllables, if augmented 1 does not follow in the series. The other 1r syllables are comprised of three or four *mātrās,* although the change of pitch gives the impression of two *mātrā*s.

Example 25 (NK). 1 *mātrā*=sixteenth note. Kaśyapasya Barhiṣīyam. (GG 1.2).

♩=100
g=g

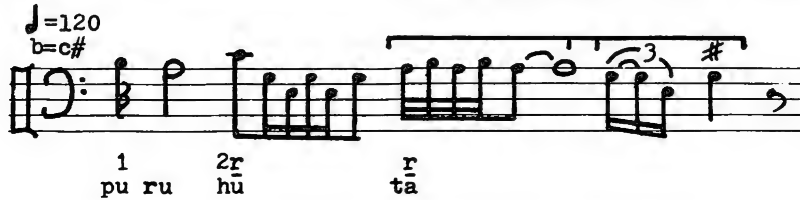

1 r r r
gṛ ṇā no ha vya dā

2r

An isolated 2r syllable, or the final 2r in a series of 2-notated syllables, is prolonged to varying durations, but the average length in the T style appears to be six to eight *mātrās*. A tripartite arrangement is evident, however.
Example 26 (T). 1 mātrā = eighth note. Bārhaspatyam (GG 91.1).

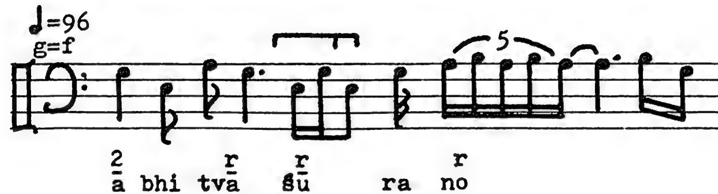

A 2r syllable in this same context was awarded twenty-six *mātrās* by a NK singer, but the three divisions typical of prolated/augmented syllables are present.
Example 27 (NK). 1 *mātrā* = sixteenth note. Raudram II (GG 115.3).

In a series of 2-notated syllables with several 2r syllables, all except the last consist of two *mātrās* according to this T reading.
Example 28 (T). 1 *mātrā* = sixteenth note. Gautamasya Parkaḥ (GG 1.1).

The NK Sāmavedīs observe this rule only if two or four or more 2r syllables occur in the series. If three occur, then only the second of two consecutive 2r syllables is worth two *mātrās*.
Example 29 (NK). 1 *mātrā* = eighth note. Rathantaram (ŪhyG 1.1.1).

However, three or more 2r syllables prior to a final 2r consist of one or two *mātrās* in this NK interpretation. Note that the two pitches associated with each syllable produce two clearly defined divisions.
Example 30 (NK). 1 *mātrā* = eighth note. Bhakāra-Rathantaram (on ŪhyG 1.1.1).

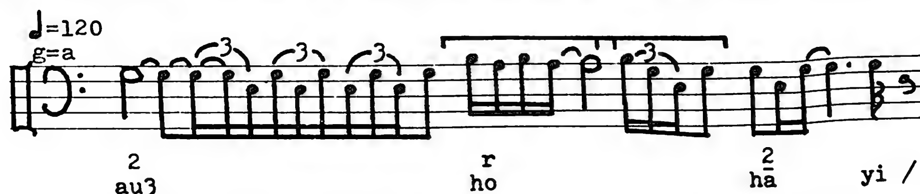

3r

According to this T reading, a 3r-notated syllable prior to a differently notated syllable is worth five *mātrās*. Two overall divisions are heard, however.
Example 31 (T). 1 *mātrā*=eighth note. Vāmadevyam (ŪG 1.1.5).

The NK singers may allot as much as sixteen *mātrās* to such a syllable, although here a tripartite structure can be visualized.
Example 32 (NK). 1 *mātrā*=sixteenth note. Vāmadevyam (ŪG 1.1.5).

However, when 3r is followed by the sequence 2 ₃ the NK chanters reduce the duration (to six *mātrās* here, arranged in two segments).
Example 33 (NK). 1 *mātrā*=sixteenth note. Raudram I (GG 115.2).

4r

Initial 4r before 5 embraces seven *mātrās*, distributed over three sections, in this T realization (details on NK practice are not available).
Example 34 (T). 1 *mātrā*=eighth note. Bārhaspatyam (GG 91.1).

But initial 4r before the sequence 5_6 contains about two *mātrās* in this passage.

Example 35 (T). 1 *mātrā*=eighth note. Rathantaram (ŪhyG 1.1.1).

The NK chanters render the identical excerpt in four *mātrās*, but segmentation into two equal parts is possible.

Example 36 (NK). 1 *mātrā*=sixteenth note. Rathantaram (ŪhyG 1.1.1).

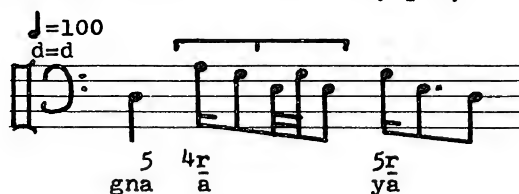

A 4r syllable between two 5-notated syllables contains six or seven *mātrās* in each tradition. There seems to be a bipartite division in each case.

Example 37 (T). 1 *mātrā*=sixteenth note. Kaśyapasya Barhiṣīyam (GG 1.2).

Example 38 (NK). 1 *mātrā*=sixteenth note. Kaśyapasya Barhiṣīyam (GG 1.2).

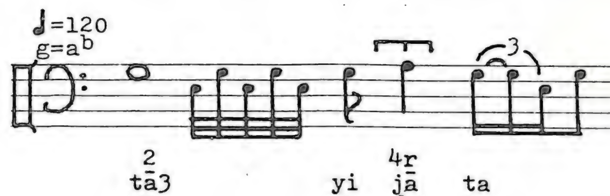

When 4r is preceded by the sequence 2_3 (or by a 3- or 4-notated syallable), then this 4r has two or three *mātrās* in the T tradition, four to fourteen *mātrās* in that of NK. In both cases a division into two segments can be postulated.

Example 39 (T). 1 *mātrā*=eighth note. Āmahīyavam (ŪG 1.1.1).

Example 40 (NK). 1 *mātrā*=sixteenth note. Āmahīyavam (ŪG 1.1.1).

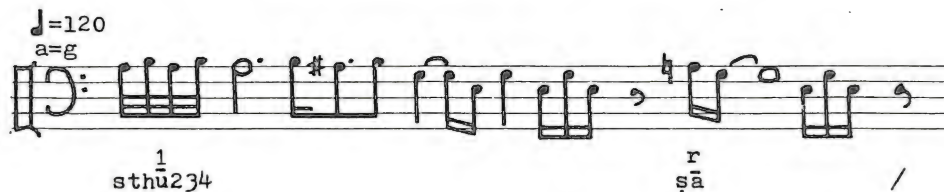

A 4r syllable final in the *parvan* and occurring after the sequence 1_{234} is allotted five or six *mātrā*s in T, twenty or more *mātrā*s in NK. The proper segmentation into larger divisions is not readily apparent: a two- or three-part scheme is possible in each case.

Example 41 (T). 1 *mātrā*=eighth note. Rathantaram (ŪhyG 1.1.1).

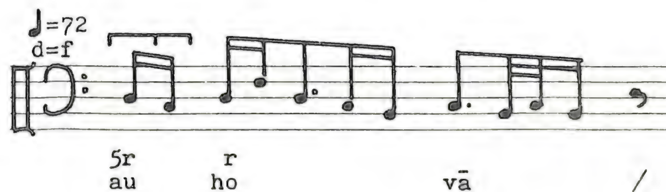

Example 42 (NK). 1 *mātrā*=sixteenth note. Rathantaram (ĀrG 49.1).

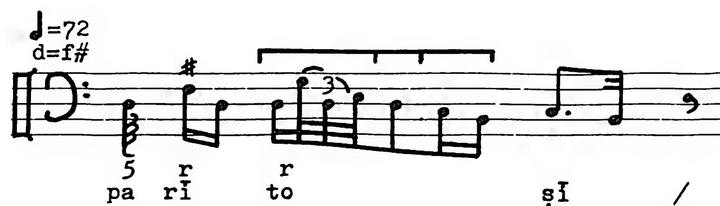

5r

According to the T practice, in a series of 5-notated syllables the first of two consecutive 5r syllables comprises two *mātrā*s, provided that another 5r does not appear in the series. The second 5r syllable in this context contains six or seven *mātrā*s, distributed over three segments.

Example 43 (T). 1 *mātrā*=sixteenth note. Gautamasya Parkaḥ (GG 1.1).

Example 44 (T). 1 *mātrā*=sixteenth note. Rayiṣṭham (GG 512.2).

The NK chanters assign about four *mātrās* to the first 5r, as much as twenty-two *mātrās* to the second. Two and three divisions, respectively, result.
Example 45 (NK). 1 *mātrā*=sixteenth note. Mārgīyavam (GG 115.1).

Example 46 (NK). 1 *mātrā*=sixteenth note. Raudram I (GG 115.2).

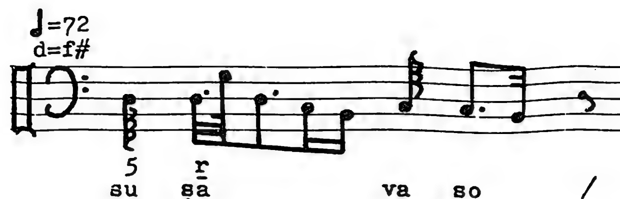

However, in this tradition when two consecutive 5r syllables are followed at some point by a third 5r, the first has about fourteen *mātrās* allotted to three sections, the second six *mātrās* allotted to two sections, the third in excess of twenty *mātrās* allotted to three sections.
Example 47 (NK). 1 *mātrā*=sixteenth note. Raudram II (GG 115.3).

A single 5r syllable, including those followed by differently notated syllables and those final in the *parvan*, is worth approximately six *mātrās* in T, slightly more or less in NK. The proper segmentation is not readily apparent, but a two- rather than a three-part arrangement seems to be more plausible.
Example 48 (T). 1 *mātrā*=sixteenth note. Sāṃvargaḥ (GG 11.1).

Example 49 (T). 1 *mātrā*=sixteenth note. Rayiṣṭham (GG 512.2).

Example 50 (NK). 1 *mātrā*=sixteenth note. Āmahīyavam (ŪG 1.1.1).

Example 51 (NK). 1 *mātrā*=sixteenth note. Indrasya Priyam II (GG 372.2).

C. *Prolated/Augmented Syllables*

Prolated/Augmented 1

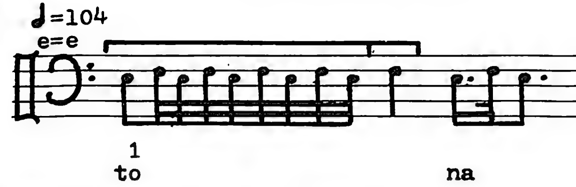

In the T tradition prolated/augmented 1 may possess ten times the value of a short syllable. Three overall divisions are discernible, however.

Example 52 (T). 1 *mātrā* = eighth note. Gāyatram.

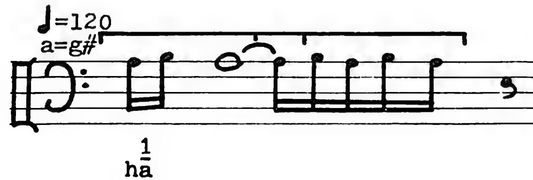

However, when two prolated/augmented 1 syllables occur in succession, the first is abbreviated (usually five to seven *mātrās*). This abbreviation may take place also when short 1 follows. In such cases two instead of three divisions result.

Example 53 (T). 1 *mātrā* = eighth note. Rathantaram (ŪhyG 1.1.1).

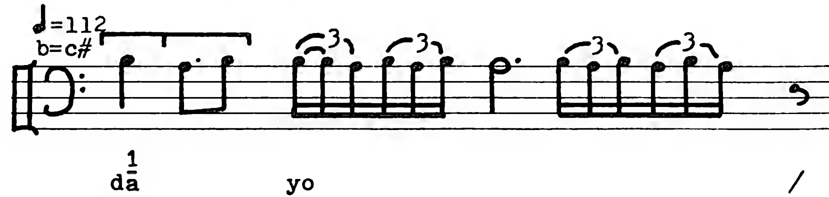

An ensuing sequence beginning with figure 1 (1234, for instance) may also cause shortening of a preceding prolated/augmented 1 syllable. The NK chanters likewise extend prolated/augmented 1 far beyond the bounds of three *mātrās.* In the following example it consists of nearly two dozen *mātrās*, although a tripartite arrangement may be intended.

Example 54 (NK). 1 *mātrā* = sixteenth note. Mārgīyavam (GG 115.1).

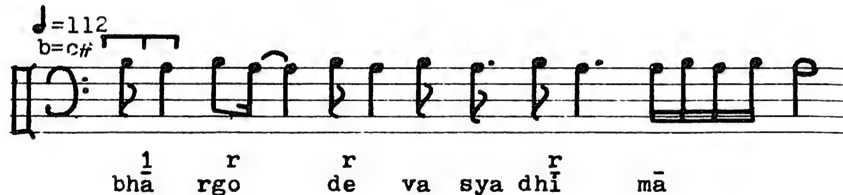

However, they also abbreviate under the conditions just described (to four *mātrās* in this excerpt). Two segments result here as well.

Example 55 (NK). 1 *mātrā* = eighth note. Gāyatraṃ.

In a series of 1-notated syllables with two or more non-consecutive prolated/augmented syllables, they sing all but the last of these as ordinary 1r syllables (three *mātrās* in this instance, although the two tones give an impression of a bipartite division).

Example 56 (NK). 1 *mātrā* = eighth note. Gāyatram.

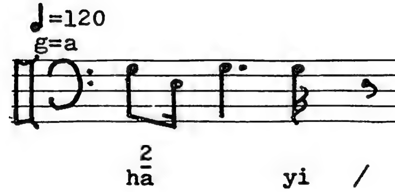

Prolated/Augmented 2

In both traditions prolated/augmented 2 is normally held six to ten times the duration of a short vowel. A three-part division is probably understood to be present but will not be specified in the following two examples.

Example 57 (T). 1 *mātrā* = eighth note. Vāmadevyam (ŪG 1.1.5).

Example 58 (NK). 1 *mātrā* = sixteenth note. Vāmadevyam (ŪG 1.1.5).

Prolated/Augmented 3

(Examples of prolated/augmented 3 are absent in the transcribed specimens.)

Prolated/Augmented 4

In the following two examples initial prolated/augmented 4 followed by prolated/augmented 4 that is final in the *parvan* lasts nine *mātrās* in the T interpretation, about five *mātrās* according to NK practice. An overall triple division is suggested.

Example 59 (T). 1 *mātrā* = sixteenth note. Gautamasya Parkaḥ (GG 1.1).

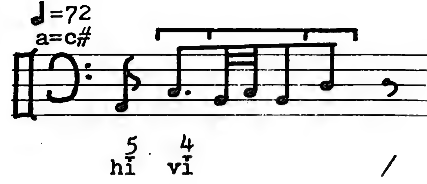

Example 60 (NK). 1 *mātrā* = sixteenth note. Gautamasya Parkaḥ (GG 1.1).

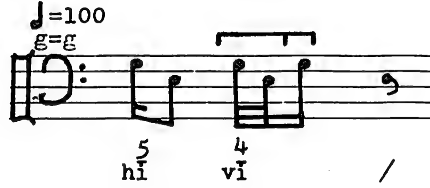

Final prolated/augmented 4 is allotted from five to eight *mātrās* in T, from two to seven *mātrās* in NK (where the duration depends on the pitch of the preceding tone). Ordinarily the effect is that of division into three segments.

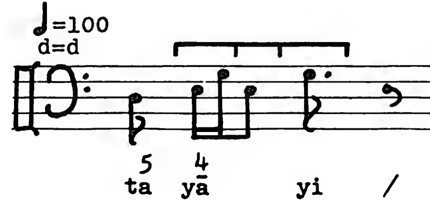

Example 61 (T). 1 *mātrā* = sixteenth note. Kaśyapasya Barhiṣīyam (GG 1.2).

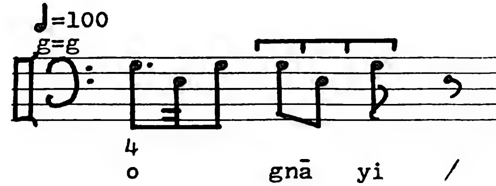

Example 62 (NK). 1 *mātrā* = sixteenth note. Kaśyapasya Barhiṣīyam (GG 1.2).

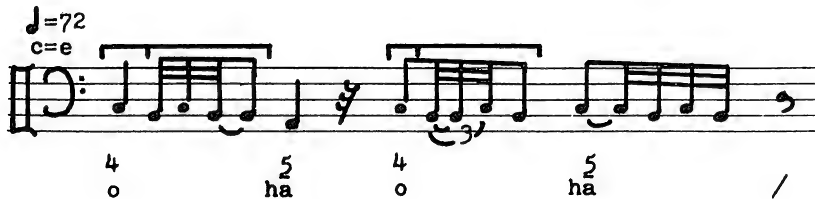

Example 63 (NK). 1 *mātrā* = sixteenth note. Gautamasya Caiva Parkaḥ (GG 1.3).

Example 64 (NK). 1 *mātrā* = sixteenth note. Gautamasya Parkaḥ (GG 1.1).

Initial or medial prolated/augmented 4 before and/or following a 5-notated syllable is worth about five to eight *mātrās*, grouped apparently into two sections, in T, approximately twelve *mātrās*, grouped possibly into three sections, in NK. Example 65 (T). 1 *mātrā* = sixteenth note. Mahāvaiśvāmitram I (GG 343.6).

Example 66 (NK). 1 *mātrā* = sixteenth note. Mārgīyavam (GG 115.1).

Medial prolated/augmented 4 preceded by a 3- or 4-notated syllable and followed by a (final?) 5-notated syllable contains approximately three *mātrās*, sometimes more, according to T realization.
Example 67 (T). 1 *mātrā* = sixteenth note. Janitram II (GG 484.2).

The NK habit is to assign about six *mātrās* to this type of syllable. Whether a duple or triple division is intended is open to question.
Example 68 (NK). 1 *mātrā* = sixteenth note. Vāmadevyam (ŪG 1.1.5).

However, when prolated/augmented 4 immediately precedes, this syllable's duration is increased to eleven *mātrās*, grouped in three sections; the preceding syllable possesses two *mātrās*.
Example 69 (NK). 1 *mātrā* = sixteenth note. Indrasya Priyam III (GG 372.2).

Prolated/Augmented 5

In T initial prolated/augmented 5 followed by final prolated/augmented 5 contains five or six *mātrās* (three overall divisions). An NK Brāhmaṇ gave only two *mātrās* to the identical syllable.
Example 70 (T). 1 *mātrā* = eighth note. Rathantaram (ŪhyG 1.1.1).

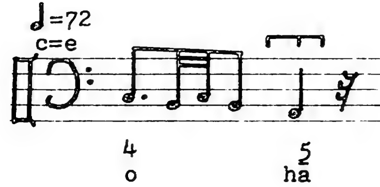

Example 71 (NK). 1 *mātrā* = eighth note. Rathantaram (ŪhyG 1.1.1).

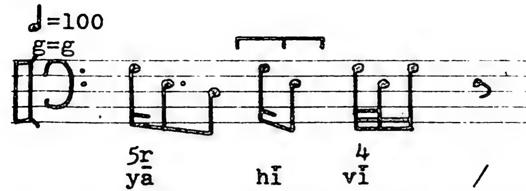

Medial prolated/augmented 5 is worth three or four *mātrās* in each tradition. A bipartite division is obvious in each instance.

Example 72 (T). 1 *mātrā* = sixteenth note. Mahāvaiśvāmitram I (GG 343.6).

Example 73 (NK). 1 *mātrā* = sixteenth note. Kaśyapasya Barhiṣīyam (GG 1.2).

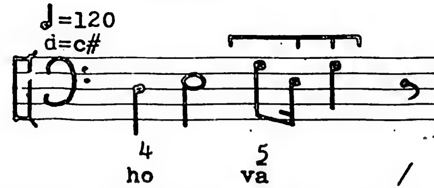

In the T and NK traditions final prolated/augmented 5 is comprised of approximately three to seven *mātrāa*, grouped into three divisions, if the syllable is without *gati* elongation (see ML 1.15, 3.1-2) or is not closed by a consonant (excluding nasals) or *visarga (ḥ). Parvans* consisting solely of single prolated/augmented 5 also have this value.

Example 74 (T). 1 *mātrā* = eighth note. Vāmadevyam (ŪG 1.1.5).

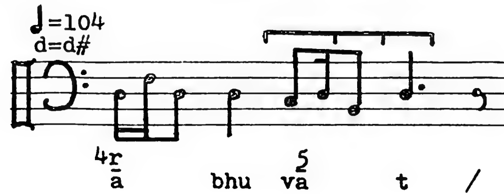

Example 75 (NK). 1 *mātrā* = sixteenth note. Mārgīyavam (GG 115.1).

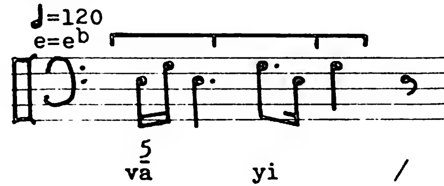

Final prolated/augmented 5 extended by the addition of *gati* or possessing a final consonant (including *visarga*) is worth from three to five *mātrās* in T, around fifteen *mātrās* in NK. Presumably, under these conditions *parvans* consisting solely of a single prolated/augmented 5 syllable also have this duration. A threefold division is manifested in both traditions.

Example 76 (T). 1 *mātrā* = eighth note. Vāmadevyam (ŪG 1.1.5).

Example 77 (NK). 1 *mātrā* = sixteenth note. Mārgīvavam (GG 115.1)

4

In Sharma 1969 : 25 it is pointed out "[these] sentences [of the commentary] are vague" and that "it is clear that many words, perhaps even passages, have been left out here by the scribe." Verse 555 of the Pūrvārcika ends with the word *dhiyaḥ,* which, in the two Sāmarājam chants (GG 555. 4-5), becomes

 3 5
dhī234yāḥ
and
 4
dhā5yā656ḥ,
respectively. In both cases prolation is present on the final vowel, although the second example is extended from three to twelve *mātrās* through the addition of the figures 6, 5, and 6—each worth three *mātrās* (see the notes to ML 1.19).

5

The sacred syllable *ōm* is found at the end of the *prastāva* section of the Gāyatram (*"tat savitur vareṇiyŌM," "upāsmai gayatā narŌM,"* and so forth)

and at the beginning of the *udgītha* section. During the Vedic ritual the Udgātr priest replaces the original syllables of the *udgītha-* and *upadrava*-sections of the Gāyatram by *ō*-vowels, representing *ōm*. However, the three and one-half measurement does not apply to these *ōkāras*, which possess the durations of the original syllables (see Howard 1983: 323-24). It is the practice of some chanters to preface each and every chant with the sacred syllable. The *ōm* that introduces the *udgītha* has very near the measurement prescribed by the ML (see Howard 1983: 323), if *mātrā* is to be interpreted strictly as the length of a short syllable. However, the *ōm* that concludes the *prastāva* consists of approximately three overall segments (see Example 52). Presumably the extra one-half *mātrā* belongs to the final *m* (see the commentary on ML 1.6).

6

In the Sāmavedic chants those syllables having short vowels, and consequently the one-*mātrā* time value, ordinarily are heard for only a fraction of a second and hence are musically rather unimportant. The duration of these short vowels is not the same as that of individual consonants, which possess one-half *mātrā*. It is noted in Allen 1953 : 84 that "the *mātrā* concept has no justification in connexion with consonants," despite statements to the contrary in the Taittirīya-and Vājasaneyi-Prātiśākhyas. Assignment of time value of consonants is, therefore, nothing more than a theoretical exercise.

7

The traditional order of the simple vowels is *a, ā, i, ī, u, ū, ṛ, ṝ*. Each short vowel and the long vowel that follows it belong to a specific phonetic class. Vowels *a*, and *ā* are "glottal" sounds in that they are produced at the glottis, the opening between the vocal cords in the larynx. Vowels *i* and *ī* are described as "palatal" because they originate with the middle of the tongue raised near the palate, the roof of the mouth. Vowels *u* and *ū* are "labial" sounds due to the roundness and protrusion of the lips when these vowels are articulated. Vowels *ṛ* and *ṝ* are "retroflex", that is, sounded by raising and bending backwards the tip of the tongue.

8

The diphthongs are the vowels *e, o, ai,* and *au*. They are composites of simple vowels : *e* = *a* + *i*, *o* = *a* + *u*, *ai* = *ā* + *i*, *au* = *ā* + *u*. When it is considered that *ā* = *a* + *a*, the commentator's statement that the diphthongs owe their existence to the prefixed *a*-vowel becomes understandable. They are classified according to the quality of the second of the two vowels. Hence *e* and *ai* are viewed as palatal, *o* and *au* as labial.

10

Vowels are the carriers of musical sound and are named *svaras* as a result. This holds true for recited verses as well as for chanted melodies. The quotation in the commentary is a play on the term *svara* ("sound"). The reader is reminded that the Vedic *svara* is not the same as the *svara* of the classical music, where the term refers to a degree of a scale.

11

The time value of the *kalā* is absolute, while the *mātrā's* duration depends on the tempo selected by the chanter. According to Nārada-Śikṣā 1.6.21, "one should perform in the fast *vṛtti* (style) when studying, but in a moderate tempo when reciting, and in the slow *vṛtti* for the instruction of pupils" (Rowell 1977 : 89).

Kalā is a Vedic word that appears, for instance, in the Ṛgveda, the Taittirīya-Saṃhitā, the Śatapatha-Brāhmaṇa, and the Ṣaḍviṃśa-Brāhmaṇa. *Kalā* is perhaps derived from the root *kal* ("to calculate, to enumerate"), as is the similar word *Kāla* ("time"). In its Vedic sense *kalā* implies "a part of something." Its use in designating a subdivision of the *mātrā* is met not only in the ML but also in Dvijarājabhaṭṭa's commentary on Saṃhitopaniṣad-Brāhmaṇa 1.21, where he quotes ML 1.11-12 and Nārada-Śikṣā 1.6.21 (see Sharma 1965 30-31). The *brāhmaṇa* passage refers to the three tempi not as fast *(druta)*, moderate *(madhyama)*, and slow *(vilambita)* but as entirely unaugmented *(sarvāvṛddha)*, entirely augmented *(sarvavṛddha)*, and additionally augmented and [sung] in secret *(utsedhaparokṣavṛddha)*. In his commentary Dvijarājabhaṭṭa echoes the declaration in the ML (which he calls Chandogapariśiṣṭa) that the fast tempo *(avṛddha)* contains 3 *kalās*, the moderate *(vṛddha)* 4, the slow *(utsedhaparokṣavṛddha)* 5. However, he emphasizes that these tempi are related by the *brāhmaṇa* to the *ārcika*, the collection of source verses. Hence the 3 : 4 : 5 correspondence holds true for recited verses as well as for chanted melodies. In the introduction to Sharma 1965 : 30-31 it is stated that Dvijarājabhaṭṭa may have lived in the fifteenth century. If this is so, then the ML, which he quotes, must be at least that old. He does not refer to the ML author(s) by name but calls him/them instead the *"pariśiṣṭakāras."* Concerning the age of the Saṃhitopaniṣad-Brāhmaṇa, Parpola has given reasons for supposing that it is a very ancient work predating the Lāṭyāyana-Śrautasūtra, which he estimates was composed between 400 and 300 B.C. (see Parpola 1968 : 28, 89; Parpola 1969 : 242-243, n. 2). If this is true, then the characterization of the tempi as *sarvāvṛddha*, and so on, may be the original one.

12

The colours assigned to the three tempi are also those associated with Vāyu, whose chariot is pulled by red horses, with Bṛhaspati, who has a blue back, and with Sūrya, who is called a white and brilliant horse (see Macdonell 1898 : 82,

101, 31). Saṃhitopaniṣad-Brāhmaṇa 1.21 (see above) connects the three tempi to Vāyu, Indra, and Agni.

13

The meaning appears to be that one tempo must be kept throughout. Tempo cannot be changed from one syllable to the next; therefore, in the course of a chant the *mātrā* has a fixed value.

15

Gati ("[vocalic] affix") involves the addition of *i* or *u* to *ā* and the resulting formation of a diphthong from a simple vowel. However, there are instances of *gati* appendages to diphthongs; moreover, the semivowel *y* may be inserted between the two vowels (*hoyi* is an example of both of these practices). Whereas normal diphthongal pronunciation requires the rather rapid coalescence of the two sounds, in the Sāmavedic chants the first vowel is held for a discernible period of time, after which the second vowel is intoned fairly quickly. Therefore, there is a clear distinction between the two vowels—in fact, in the chants the vowels are written separately (*āi* in place of the customary *ai, āu* instead of *au*) and have specific time values allotted to them (see ML 3.2). Yet, even with the interpolated *y*, the two letters are considered components of a single syllable, which may be either long or augmented. Why did the composers of the chants utilize this method of vowel modification? It would appear that there was a vocal preference for the glottal vowel *ā*, especially on syllables that were musically prolonged.

16

Having discussed the short, long, and prolated/augmented classifications of those syllables with only a single notated numeral, the ML author now proceeds to give the durations of syllables having two or more figures. Those numbers after the first are given not above but within the textual line, after the syllable in question. Prolated/augmented syllables and syllables with sequences carry the principal musical phrases in a given chant. A syllable with a sequence is classified by the ML according to whether it does or does not have the time value of syllables in the *ārcika*, the collection of accented source verses. As a rule, in the *ārcika* syllables are either short or long (one or two *mātrās*). The "syllable divorced from accentuation" (*visvaram akṣaram*) has a value in excess of that allowed on *ārcika* syllables, for each notated numeral is worth three *mātrās*. Those sequences having the time value of *ārcika* syllables (*ārciko 'kṣarakālaḥ*) are discussed elsewhere (ML 3.3-7).

17

Those sequences with durations above those of the accented source verses are given the names *pratyutkrama* ("ascent" : see Simon 1908 : 521, Simon 1913 : 313-14, Howard 1977 : 44-48), *atikrama* ("omission" : see Simon 1908 : 516, Simon 1913 : 313, Howard 1977 : 48-50), *karṣaṇa* ("extension" : see Simon

1908: 518-20, Simon 1913: 314, Howard 1977: 50-62), and *svāra* ("having [musical] sound": see Simon 1908: 525, Simon 1913, 315, Howard 1977: 66-69).

19

The second sentence of the commentary is partially corrupt (see Sharma 1969: 147). Of the two quotations from the *gānas,* the following occurs in several *sāmans,* including the chant that is specified:

5
vā656 (GG 396. 1 : Śundhyus Sāma).

The fragment *vāyuḥ javāno ho* has not been identified. The second quotation refers to

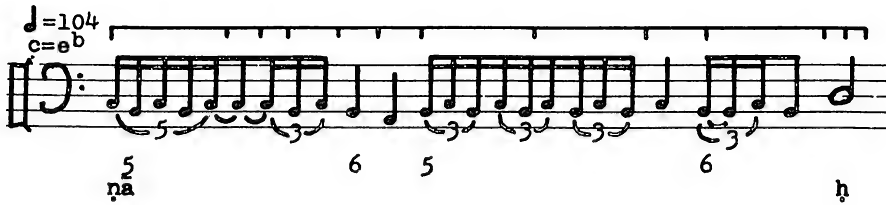

3 2 4
kay ā3sthā5irā656n (GG 13. 1 : Śnābham).

The sequence 5656 is termed *parisvāra.* It has the *pratyutkrama* feature in that ascent is made from the *atisvārya mudrā* (the lower end of the little finger) to the low *mudrā* (the middle of the little finger). Since this sequence contains four numerals, each worth three *mātrās*, a total of twelve *mātrās* results. A T Sāmavedī exceeds this duration by seven *mātrās;* if one were to divide the music into twelve approximately equal segments, each segment would be roughly equivalent to a quarter note, not an eighth note. Rather than specifying the sequence as

5
ṇā656 . . . ḥ,

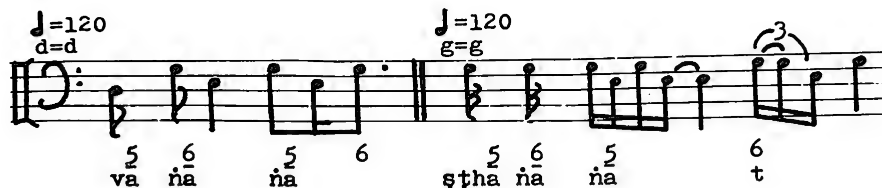

I have spaced out the four numbers in order to indicate the probable spots where the corresponding *mātrās* occur. In other examples as well I have adapted the numbers of a sequence to the music that they symbolize.

Example 78 (T). 1 *mātrā* = eighth note. Kāvam (ŪG 1.1.13).

As far as the total number of *mātrās* is concerned, the NK chanters come very close to the prescription of the ML (see Howard 1977: 130). However, the apportionment of *mātrā* among the numerals is uneven and hence will not be indicated. With each appearance of numeral 6 they nasalize, thus giving credence to an optional name for the sequence: *padānusvāra* (see Simon 1908: 521, Howard 1977: 45).

Example 79 (NK). 1 *mātrā* = sixteenth note. Tānvam II (GG 128.2) and Syaumaraśmam II (GG 323.4).

Like the T Sāmavedīs, the Jaiminīyas do not nasalize at the places where 5_{656} is found in the notation. Their syllable notation has the conjunct *tr* as the 5_{656} equivalent (see Howard 1988).

20

Examples of 5_4 have not been transcribed. The sequence should bear two + three = five *mātrās* (see ML 2.3).

21

According to the T practice the sequence 4_3 consists of the ML-prescribed six *mātrās* only when followed by 2r (or short or prolated/augmented 2?), in which case it should contain not six but five *mātrās* (see ML 2.3). When followed by 2_3 or when final in the *parvan,* 4_3 exceeds this valuation. Dividing the music into five or six segments would be speculative.

Example 80 (T). 1 *mātrā* = sixteenth note in the first extract, an eighth note in the remaining specimens. Vāco Vratam II (ĀrG *stobha,* before 94.1), Vāmadevyam (ŪG 1.1.5), Rathantaram (ŪhyG 1.1.1), Rathantaram (ŪhyG 1.1.1).

The NK singers always assign more time units to 4_3 than the ML allows : three or four times the expected duration is common, although six uneven segments are perceivable in this example (where 4_3 is final in the *parvan*).

Example 81 (NK). 1 *mātrā* = sixteenth note. Rathantaram (ĀrG 49.1).

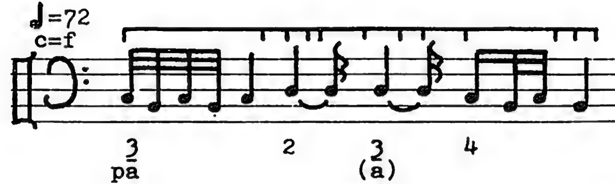

The Jaiminīya symbol corresponding to 4_3 is the compound sign *ṇ-ph* (see Howard 1988).

22

According to ML 2.3 the first two numbers of the pattern 3_{234} should have five *mātrā*s not six : two units should be allotted to 3, three units to 2. Hence eleven *mātrā*s should result from the four *mudrā*s. In fact, eleven unequal segments can be postulated in the following T excerpt.

Example 82 (T). 1 *mātrā* = eighth note. Bārhaspatyam (GG 91.1).

Although they tend to exceed the expected durations, the NK Sāmavedīs give more emphasis to 3 than to 2. Postulating eleven divisions would amount to sheer speculation.

Example 83 (NK). 1 *mātrā* = sixteenth note. Gautamasya Parkaḥ (GG 1.1) and Mārgīyavam (GG 115.1).

The Jaiminīya equivalent of 3_{234}—and also, in fact, of $3_{2345}^{\;\;111}$—is *kh* (see Howard 1988).

23

The *pratyutkrama pattern* 2_1 should likewise consist of five *mātrā*s (see ML 2.3). The following extract from a T performance gives four *mātrā*s to the second *mudrā*, about five *mātrā*s to the first. However, five segments, each a quarter-note in duration, are apparent in the example.

Example 84 (T). 1 *mātrā* = eighth note. Āmahīyavam (ŪG 1.1.1).

When realized by a NK chanter the two numbers possess six and seven *mātrā*s, respectively. Here too a quintuple division, though one consisting of unequal segments, has been devised.

Example 85 (NK). 1 *mātrā* = sixteenth note. Gautamasya Caiva Parkaḥ (GG 1.3).

The sequence has *y* as its counterpart in the Jaiminīya syllabic system (see Parpola 1973 : 19, 21; Howard 1988).

24

The syllable *pā* or the word ^{0}*pāvne* is divided between two successive *parvans:*

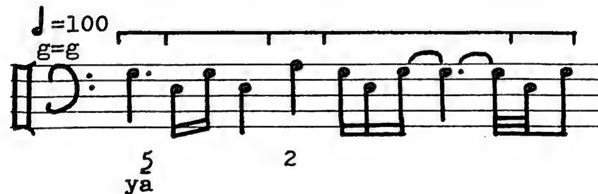

5r 3r
. . . pā / ā . . . .

Therefore, in this unusual case a sequence is not involved; the two components combined amount to four *mātrā*s (see ML 2.6). This chant was not recorded by me.

25

A rare occurrence of 5_2, as interpreted by a NK Brāhmaṇ, shows twelve *mātrā*s on the low (fifth) *mudrā*, sixteen on the second. Theoretically the sequence should possess three + three = six *mātrā*s; however, a two + three segmentation is apparent here.

Example 86 (NK). 1 *mātrā* = sixteenth note. Aiḍaṃ Kāvam (GG 554.2).

26

Pratyutkrama from 3 to 1 occurs, for example, between the final two numbers of the sequence 2_{31}. A T singer gave two *mātrā*s to the third *mudrā*, five to the first. Here the sequence 2_3 (*praṇata:* see ML 3.3-5), worth two *mātrā*s, is extended by means of a three-*mātrā mudrā*. Five unequal divisions are apparent here.

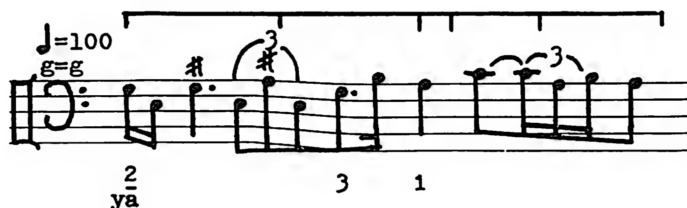

Example 87 (T). 1 *mātrā* = sixteenth note. Yaśaḥ Sāma (ĀrG 61.1).

In a NK reading 3 has three or four *mātrā*s, while 1 possesses ten *mātrā*s. A five-part segmentation is heard here as well.

Example 88 (NK). 1 *mātrā* = sixteenth note. Śaikhaṇḍinam I (GG 342.1).

(GG 342.1).

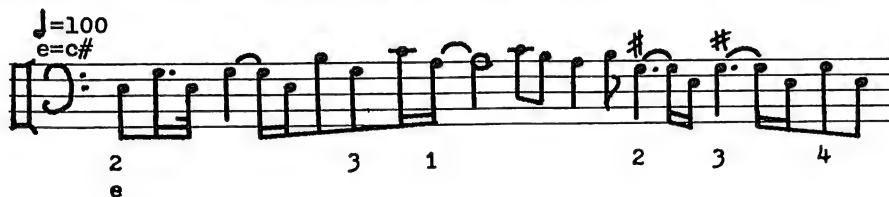

NK executions of 2_{312} and 2_{31234}, both extensions of *praṇata*, likewise show about three *mātrā*s for the third *mudrā*; however, the *svara* connected with the thumb is held up to nineteen *mātrā*s. The first three numbers of each sequence would be divisible into five parts, as in the previous example.

Example 89 (NK). 1 *mātrā* = sixteenth note. Vāravantīyam II (GG 17.2).

Example 90 (NK). 1 *mātrā* = sixteenth note. Ṛtusāma II (GG 64.2).

27

Atikrama involves the omission of one or more fingers in skipping from one *mudrā* to another. This omission may take place either in ascent or descent, although the ascending patterns (5 to 3, 5 to 2, and 3 to 1) have already been discussed as examples of *pratyutkrama* (see also Howard 1977: 46, 49-50). Therefore, only the four descending types are identified here. The commentator saves his remarks until the conclusion of the *atikrama* precepts.

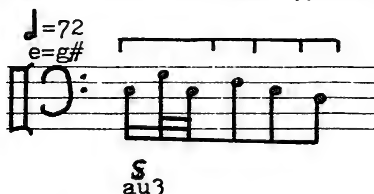

28, 29, 30, 31.

Ordinarily the symbol 11 is used to designate *kruṣṭa* in the chantbooks (see Howard 1977: 30-31). In South India, and occasionally in the North, the *kruṣṭa-mudrā* is kept distinct from the *prathama-mudrā* (see Howard 1977: 105-8): accordingly, the thumb is held at a distance of one *yava* (the length of a barley corn) above the index finger when the *prathama-mudrā* is desired, two *yavas* above when the *kruṣṭa-mudrā* is called for (see Tarlekar 1985:69) This hand position may well be a later addition to the notation, for Puṣpasūtra 9.26 declares that the *kruṣṭa-svar* occurs in only two chants (see Simon 1908: 712; Howard 1977:30, n. 2; Tarlekar 1985:73). The peculiar method of effecting *atikrama* of 1 in crossing from 11 to 2 has already been illustrated, in Howard

1977: 105-6. Here a T interpretation shows sixteen *mātrās* connected with the *kruṣṭa-mudrā*, only one or two *mātrās* with the second *mudrā*. The habit of the NK Brāhmaṇs in this matter has not been documented.

Atikrama of 2 in crossing from 1 to 3 is known also as *namana* (see Howard 1977: 62-64; in Tarlekar 1985:58 *namana* is identified as 1_32). It is customary to place the *avagraha* (ऽ) above the syllable bearing the sequence. In a T performance six *mātrās* are given to the first *mudrā*, only two *mātrās* to the third. The overall division shows three segments connected with 1, only one segment with 3.

Example 91 (T). 1 *mātrā*=sixteenth note. Rayiṣṭham (GG 512.2).

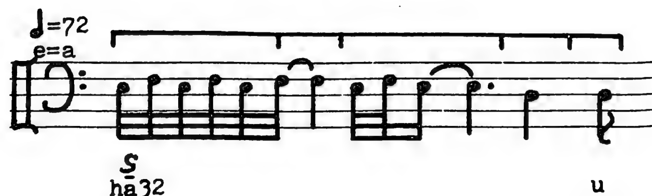

A NK Brāhamaṇ assigns twelve *mātrās* to 1, four *mātrās* to 3. Five divisions are in evidence here (3 is followed by 2_3).

Example 92 (NK). 1 *mātrā*=sixteenth note. Indrasya Priyam II (GG 372.2).

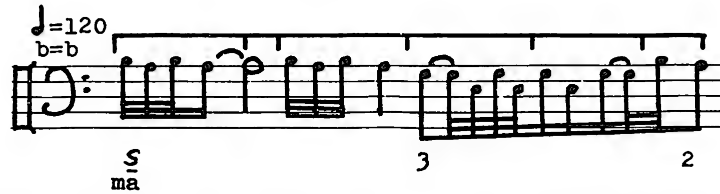

One comes across instances of *namana* that have been extended through the addition of extra numbers. Such an example is the following specimen, where a T Brāhmaṇ gives the three numbers seven, two, and one *mātrās*, respectively. The melodic contour suggests an apportionment that assigns only one division to numbers 3 and 2.

Example 93 (T). 1 *mātrā*=eighth note. Bārhaspatyam (GG 91.1).

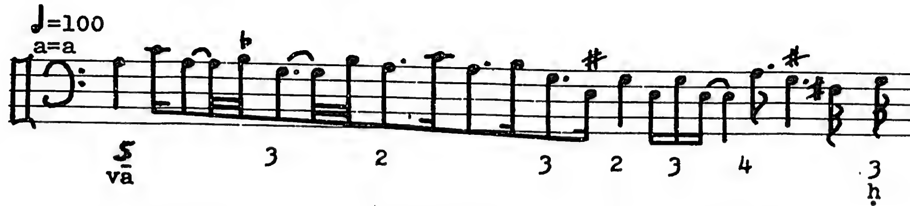

The identical sequence has sixteen, seven, and two *mātrās* assigned to the respective numbers according to a NK reading. Here 3 is apportioned into the expected two sections (see ML 2.3).

Example 94 (NK). 1 *mātrā*=sixteenth note. Āśvam (GG 116.1).

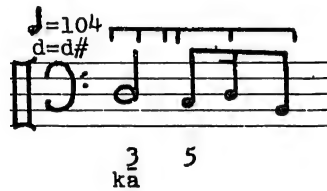

Sometimes the degree of extension reaches snakelike proportions, as in this NK excerpt. The length of the sequence has resulted in melodic compression; hence the overall divisions are obscured.

Example 95 (NK). 1 *mātrā*=sixteenth note. Vāmram Praiyamedham Vā III (GG 166.3).

Atikrama of 4 in crossing from 3 to 5 comes close to having the expected six *mātrā*s in this T interpretation. However, the overall segmentation appears to be along the lines three+two.

Example 96 (T). 1 *mātrā*=eighth note. Vāmadevyam (ŪG 1.1.5).

A NK version gives the two numbers sixteen *mātrā*s, but here also a fivefold division can be hypothesized.

Example 97 (NK). 1 *mātrā*=sixteenth note. Vāmadevyam (ŪG 1.1.5).

This type of *atikrama* is one of several numbers or number combinations connected with the Jaiminīya symbol *ph* (see Howard 1988).

Atikrama of 2, 3, and 4 in crossing from 1 to 5 is available only in a NK reading, where approximately twenty *mātrā*s are involved. The six anticipated divisions are present.

Example 98 (NK). 1 *mātrā*=sixteenth note. Aśvinor Vratam I (ĀrG 103.1).

♩=120
b=c

1
1̄   5

32.

The five types of *karṣaṇa* ("extension") are 1_2, 1_{23}, 1_{234}, 1_{2345}, and 5_6. The first is known as *preṅkha* ("shaking": see Burnell 1876:xlii, Howard 1977: 64-66), a term that has been in vogue more recently. The pattern 5_6 is another type of *parisvāra* or *padānusvāra* (see ML 1.19) in that nasalization of the vowel preceding the 6-notation is required. This is apparent in the NK tradition but entirely absent in T chants. The partially corrupt commentary (see Sharma 1969:13, n. 16) seems to imply that numeral 6 does not designate a *svara* in the usual sense but denotes rather a (nasalized) extension of a *svara* on 5. Moreover, *karṣaṇa* of the *atisvārya* (6_7) is impossible, for 7 is a symbol of the *abhigīta* (see ML 3.3-4, 7-8), which is comprised of 2 followed by 1 (not the same as the *pratyutkrama* pattern 2_1). Therefore, 6 is the only number from which *karṣaṇa* is not permitted: the remaining numbers are all "extended" or "stretched" in some fashion (the sequence 1_{2345}, for example, shows 2 stretched from 1, 3 from 2, 4 from 3, and 5 from 4). Evidently the term *karṣaṇa* is considered inappropriate for extensions resulting from *pratyutkrama* or *atikrama*.

The expected duration of *karṣaṇa type* 1_2 is six *mātrās* (five *mātrās* if I follows). However, a T chanter allots eighteen *mātrās* to the sequence in the following rendition, where six general divisions are discernible.

Example 99 (T). 1 *mātrā*=eighth note. Gāyatram.

♩=104
e=g

1
hi2

A NK performance of 1_2 for nearly thirty *mātrās*! But the six segments can be recognized here as well.

Example 100 (NK). 1 *mātrā*=sixteenth note. Sāṃvargaḥ (GG 11.1).

♩=120
a=b

1
ya2   ḥ

A special finger movement is associated with *preṅkha*: the thumb passes over the middle of the remaining fingers, from forefinger to little finger (see Howard

1977 : 80, 85).

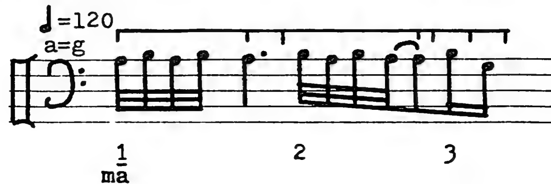

Nine *mātrās* is the expected length of 1_{23} (eight *mātrās* if 2 follows). However, its execution by a T Sāmavedī shows that 1_{23} and $1_{\bar{2}}$ are practically identical as far as performance is concerned.

Example 101 (T). 1 *mātrā*=eighth note. Vāmadevyam (ŪG 1.1:5).

There is melodic similarity in Karnataka as well, although in this performance 1_{23}, worth fourteen *mātrās*, has about half the value of the previously-described $1_{\bar{2}}$.It should be pointed out that other renditions of 1_{23} by the same chanter are more protracted.

Example 102 (NK). 1 *mātrā*=sixteenth note. Rathantaram (ĀrG 49.1).

The similarity of $1_{\bar{2}}$ and ·1_{23} undoubtedly stems from the fact that, in Jaiminīya manuscripts, the letter symbol *ṭ* occurs where $1_{\bar{2}}$, 1_{23}, and sometimes $1_{\hat{2}}$ (which is also synonymous with *ṭ-ṭ*) appear in the Kauthuma notation (see Howard 1988). The Jaiminīya notation, which employed figure symbols at one time, predates that of the Kauthumas; it is a certainty that Jaiminīya is the original school of the Sāmaveda.

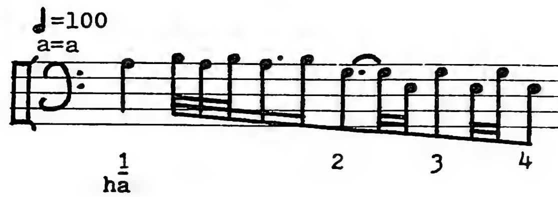

Theoretically, *karṣaṇa* of the type 1_{234} should possess twelve *mātrās*. In fact, a T realization of the sequence comes very close to this specification; but the division of each numeral into three parts is not possible.

Example 103 (T). 1 *mātrā*=eighth note. Rathantaram (ŪhyG 1.1.1).

A Karnataka Brāhmaṇ extends the sequence to seventeen *mātrās* in the following performance. Here too segmentation into twelve sections is not feasible : if such division were attempted, numerals 2, 3 and 4 would be represented by only one segment each.

Example 104 (NK). 1 *mātrā*=sixteenth note. Gautamasya Caiva Parkaḥ (GG 1.3).

This 1_{234} type of *karṣaṇa* corresponds to the Jaiminīya sign *p̣* (see Howard 1988).

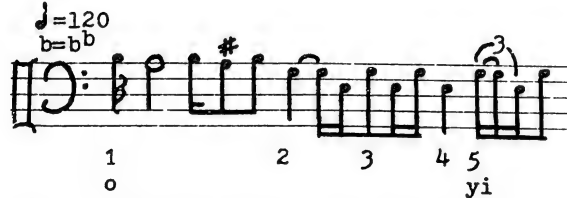

Fifteen *mātrās* should be assigned to 1_{2345}, fourteen *mātrās* if 4 follows. But nearly twice this duration is achieved in this T rendition. Speculation on a possible division into fifteen parts is fruitless.

Example 105 (T). 1 *mātrā*=sixteenth note. Hārivarṇam I (GG 383.1).

The NK singers likewise tend to double the time value. If one were to attempt some sort of partition, it appears that only one division would be associated with numbers 2, 3, 4, and 5.

Example 106 (NK). 1 *mātrā*=sixteenth note. Bṛhad-Bhāradvājam (GG 3.1).

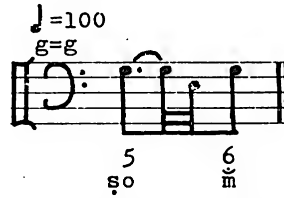

The sequence 5_6, worth six *mātrās*, is one of only two number combinations containing the *atisvārya* (6), the other being 5_{656} (see ML 1.19). The anticipated duration is approximated by a T chanter when 5_6 does not conclude the *parvan;* but when 5_6 is in final position, another Sāmavedī increases the duration to nine *mātrās*.

Example 107 (T). 1 *mātrā*=sixteenth note in the first example, an eighth note in the second. Janitram II (GG 484.2) and Rathantaram (Ūhy G 1.1.1).

A NK rendition of medial 5_6 has the characteristic nasalization and lasts precisely six *mātrās*.

Example 108 (NK). 1 *mātrā*=sixteenth note. Gautamasya Caiva Parkaḥ (GG 1.3).

The sequence is one of several numbers and number combinations associated with the Jaiminīya symbol *pl* (see Howard 1988).

CHAPTER 2

1

This and the following rule properly belong in the first chapter, where the types of "syllables divorced from accentuation" are enumerated : Chapter 2 deals largely with exceptions to these rules. However, following the practice of the oldest Sāmavedic texts, this habit of overlapping the endings and/or beginnings of sections is clearly purposeful and reflects the desire, possibly manifested first in Jaiminīya texts, to avoid ominous interruptions (see Parpola 1981).

2

The three *svāra* varieties are very common coda configurations and are found most often on final syllables of chants. *Svāra* is to be distinguished from *svara,* which in Sāmavedic music denotes musical phrases and motifs. The three types of *svāra* are

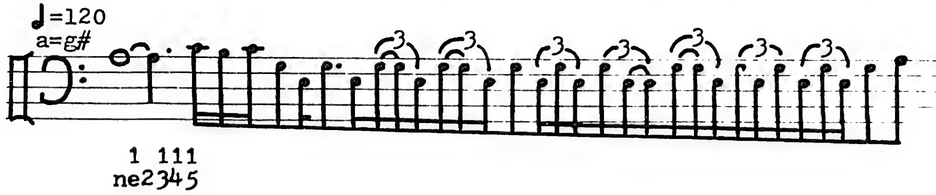

2 1 111
harī3śrī2345ḥ (GG 195.1 : Āṅgirasāṃ Hariśrīnidhanam),
3 2111
rayā345im (GG 43.1 : Āyuḥ Sāma), and
3 111
ī2345 (ĀrG 54.1 : Mahāvairājam).

The third type is known universally as the *vairājanidhana,* but it is found in chants other than the Mahāvairājam. Those numbers of *svāra* with 1 placed above are worth one *mātrā* apiece (see ML 2.10). With the exception of the first 3 of 3_{2345}^{111}, which carries two *mātrā*s (see ML 2.3), the remaining numbers are worth three *mātrā*s. *Svāra* calls for a distinctive hand movement : the thumb passes over the tips of the remaining fingers, from forefinger to little finger (see Howard 1977 : 80, 86).

Svāra of the type 1_{2345}^{111} contains not nine but twenty *mātrā*s in this rendition by a T Kauthumin. However, nine divisions of the music are easily recognized. Example 109 (T). 1 *mātrā*=sixteenth note. Kaśyapasya Barhiṣīyam (GG 1.2).

The NK Rāṇāyanīyas far exceed even this overextension: they give about fifty *mātrās* to the sequence. Partition into nine sections would be highly speculative.
Example 110 (NK). 1 *mātrā* = sixteenth note. Mārgīyavam (GG 115.1).

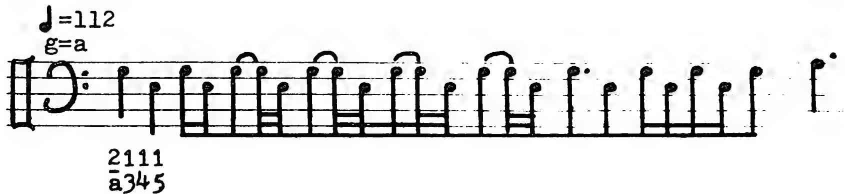

The Jaiminīya counterpart of 1_{2345}^{111} is the compound symbol *ṭ-kh* (see Howard 1988.)

Svāra of the type 2_{345}^{111} consists not of six but of seventeen *mātrās* according to the following T interpretation. Nevertheless, six general divisions are perceivable.
Example 111 (T). 1 *mātrā* = eighth note. Āmahīyavam (ŪG 1.1.1).

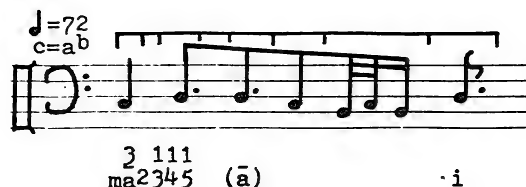

The NK singers too expand the sequence—to twenty-one *mātrās* in this performance. Apportionment into six sections would be an exercise in conjecture.
Example 112 (NK). 1 *mātrā* = eighth note. Gāyatram.

Apparently 2_{345}^{111} was not a part of the original numeral notation, which utilized 3_{2345}^{111} in its place (see Howard 1988).

Svāra of the type 3_{2345}^{111} is composed of seveteen, as opposed to eight, *mātrā*s in this T excerpt. An eightfold segmentation can be hypothesized.

Example 113 (T). 1 *mātrā*=sixteenth note. Vāco Vratam II (ĀrG *stobha*, before 94.1).

Typically, the NK Sāmavedīs lengthen even farther: they assign thirty-seven *mātrā*s to the sequence in this extract. A theoretical division into eight parts can be put forth, however.

Example 114 (NK). 1 *mātrā*=sixteenth note. Sāṃvargaḥ (GG 11.1).

To 3_{2345}^{111} corresponds the Jaiminīya letter *kh* (see Parpola 1973 : 19, 21; Howard 1988).

3

Under normal circumstances a "syllable divorced from accentuation" (*visvaram akṣaram*)—that is, a syllable with a time value in excess of that found on the accented *ārcika* syllables—contains three *mātrā*s on each numeral. Theoretically, therefore, the sequence 1_{23} should contain three + three + three = nine *mātrā*s. However, when *pratyutkrama* from 5 to 4, 3 to 2, or 2 to 1 takes place, the initial numeral in each case is worth two, as opposed to three, *mātrā*s. Hence the sequence 5_4, is worth two + three = five *mātrā*s; the numbers of 3_{234} are worth two + three + three + three = eleven *mātrā*s; the sequence 2_1 bears two + three = five *mātrā*s. In a case like $1_{23}2$, where the 3 is followed immediately by a 2-notated syllable, the sequence has this duration : three + three + two = eight *mātrā*s. Similarly, under the circumstance $1_{\dot{2}}1$ *preṅkha* has three + two = five *mātrā*s.

4

See ML 1.20, 22, 23 and 2.2 for illustrations of these combinations.

5

The sequence 2_1 in the cited example from the Aśvinoḥ Saṃyojanam is not an exception to the rule that "a syllable divorced from accentuation has triple

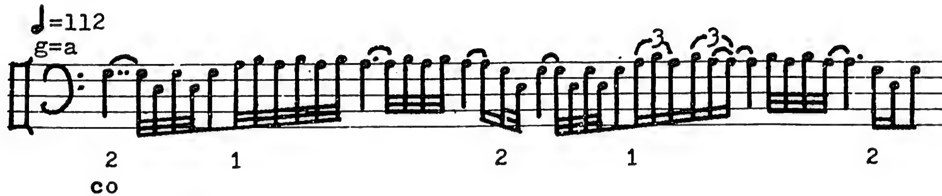

measure on every *svara*." Neither is the *avanardana* of the Gāyatram (see Howard 1983 : 322-25; Howard 1986 : 342-46) an exception : 2_{1212} has the value three + three + three + three + three = fifteen *mātrās*. An interpretation of the *avanardana* by a T chanter shows that the five numbers of the sequence bear five + nine + five + ten + six = thirty-five *mātrās*. However, the stated apportionment into fifteen parts can be easily formulated.

Example 115 (T). 1 *mātrā* = eighth note. Gāyatram.

In a NK realization the *mātrās* are distributed five + eight + five + eight + two = twenty-eight. Guessing at fifteen divisions here will not be attempted.

Example 116 (NK). 1 *mātrā* = eighth note. Gāyatram.

6

In the excerpt

5r 3r 2
. . . pā / āvnā . . .

the syllable *pā* is divided between two *parvans* (see ML 1.24). Half the syllable is sung with the low *mudrā*, half with the third *mudrā*. The syllable is *not* sung as though notated

5 2
pā3vnā,

in which case the low *mudrā* would contain three *mātrās*, the third *mudrā* two *mātrās*: another school of Sāmaveda (the Jaiminīya) renders the text *sunota somapāvnāi* (they refer to the chant as Gautamam II). But in the Kauthuma-Rāṇāyanīya tradition each of the figures contains two *mātrās*, with the customary pause beween *parvans* inserted in the middle.

7

Since the low *mudrā* on the word *accha*, occurring in the passage

4 5 111
accha2 u/vā345 (GG 543.1: Vāsiṣṭham),

is found on a short vowel, it consists of one *mātrā*. The figure 2 contains the

expected three *mātrās*. Therefore, the syllable *ccha* is worth a total of four *mātrās*.

8

Karṣaṇa of the $1r_2$ type, where the vowel in question bears the *r*-notation, is termed *dīrghakarṣaṇa* (see Simon 1913: 314, Howard 1977: 51-52). Each of the notated *mudrās* represents *svaras* that are long; hence each contains two *mātrās*. In the excerpt

1 r
praprā 2̂ (GG 35.1,4: Upahavaḥ I and Yajñāyajñīyam)

the second syllable has a duration of four *mātrās* (see Howard 1977: 51). Recordings of this type of *dīrghakarṣaṇa* are unavailable. The sequence has the compound symbol *ṭ-c* as its Jaiminīya parallel (see Howard 1988).

9

The $2r_3$ type of *karṣaṇa* is also attached to a vowel with the *r*-notation; this sequence likewise is termed *dīrghakarṣaṇa*. Each of the numbers is worth two *mātrās*; the last syllable of each of the above examples has a time value of four *mātrās*. Without consulting the oral traditions it is impossible to distinguish this type of *dīrghakarṣaṇa* from a form of the sequence *praṇata* (ss ML 3.5, Howard 1977: 70). The following NK example may be a legitimate instance of long *karṣaṇa*, although the *mātrā* values are far in excess of the anticipated four units: sixteen *mātrās* are associated with 2r, six with 3. Four sections of unequal length can be inferred from the music.

Example 117 (NK). 1 *mātrā*=sixteenth note. Pakthasya Saubharasya Sāma I (GG 110.1).

The Jaiminīya compound symbol *th-c* is the corresponding sign of the syllable notation (see Howard 1988).

10

The three types of *svāra* are 1_{2345}^{111}, 2_{345}^{111}, and 3_{2345}^{111} (see ML 2.1-2). Those figures with 1 placed above are, in theory, worth one *mātrā*. The superscribed 1 may be an outward indication of this unit value, or it may be used merely to differentiate *svāra* from the sequences 1_{2345}, 2_{345}, and 3_{2345}. In these cases the thumb touches, in turn, the finger corresponding to each number, whereas *svāra*

calls for rubbing the thumb over the tips of the fingers. This peculiar hand movement renders it difficult if not impossible to ascertain the number of *mātrā*s connected with each numeral when the oral traditions are consulted.

11

From these examples it is obvious that *hrasvakarṣaṇa* can involve either 1_2 or 2_3 combinations (see Howard 1977:52), as is the case with *dīrghakarṣaṇa*. Recordings are unavailable.

12

The examples seem to indicate three ways in which a number notated above the text is approached from a number notated either above or within the text. In the first example, 1 is approached from 2, both figures notated above. The second example has 2 within the text, at the end of a *parvan*, rising to the superscribeed 1 at the beginning of the next *parvan*. The third example shows superscribed 2 approached, in the same *parvan*, by 3 notated within the text.

13

Once a number is notated, it holds true for all subsequent syllables, until a different number appears. Thus needless repetition of the numbers is avoided. Hence in the extract

1 r 2r
gṛṇāno ha (GG 1.1: Gautamasya Parkaḥ)

the figure 1 is valid for both syllables *gṛ* and *ṇa*. At the beginning of the *parvan*

2 1 2 1 r
draviṇsyur vipanyayā2 (GG 4.1: Śrautarṣam I)

numeral 2 is the notation for syllables *dra*, *vi*, and *ṇa*. In the excerpt

23r r2
vipāṃ jyotāi (GG 98.2: Prahitaḥ II)

syllables *pāṃ* and *jyo* bear the 3-notation. The section

4r r 4
ād it pratnā5sya retasāḥ (GG 20.1: Nidhanakāmam)

has 4 notated on *ād*, *it*, *prat*, and the beginning of *nā*. At the beginning of the *parvan*

5 r 4 5
agniṃ vo vṛdhāntām (GG 21.1: Saiṃdhukṣitam I)

figure 5 holds true for syllables *a*, *gniṃ*, *vo*, and *vṛ*.

Thus the ML demonstrates the validity of this rule of continuity by giving examples that utilize each of the five basic numerals (*mudrās*). The *svara*s of the *kruṣṭa-* and *atisvārya-mudrā*s never occur on two successive syllables, a fact that underscores the relative unimportance of these *svara*s and suggests that they may in fact be later additions to the notation.

14

One-half *mātrā* is found
(1) on the *gati* vowel *i* of o^{4}gnāi (GG 1.1: Gautamasya Parkaḥ),
(2) on the *gati* vowel *u* of pre^{5r}ṣṭhaṃ vo^{5} hāu (GG 5.3 Auśanam),
(3) on the circumflexed 3 (*praṇata*: see ML 3.5) and the *visarga* of ṣu^{2} pra^{1}vo23ca^{2}3̂43ḥ (GG 28.1: Somasāma),
(4) on the initial *svara* of *abhigīta* (see ML 3.7), represented by 7, and on the final *t* of na^{1}y a^{7}kramī2̄t (GG 30.1: Sauryam),
(5) on the *gati* vowel *i* and perhaps also on the hiatus (*vivṛtti*) between the syllables *vo* and *a* of vo^{1} agnāyā2̄i (GG 35.3: Śnauṣṭhīgavam),
(6) on the circumflexed 3, the numeral 4 of the sequence 4_5 (*utsvarita*: see ML 3.6), and the final *n* of ti^{3}ya^{2}3̂ṃ ca^{4}5rā656n (GG 64.1: Ṛtusāma), (and)
(7) on the pause (*sthiramātrā*: sometimes notated *sthi*) after the exclamation *him* or *hum*, on the *gati* vowel *i* and the final *m*, and perhaps also on the hiatus between syllables *vo* and *a* of vi^{5r}śo viśo^{r} hu^{r}m *sthi* vo6 a^{5}tithāim (GG 87.1: Viśoviśīyam Aiḍaṃ Vā).

That ML 2.14 occurs in the second and not in the third chapter is another instance of textual overlapping; the material discussed above belongs with that of the next chapter, where fractional durations are examined. See the notes to ML 2.1.

CHAPTER 3

1

The two sounds are measured separately (see ML 1.15).

2

Most of the commentary on these sentences is "corrupt and hence not clearly understandable" (Sharma 1969: 17, n. 14). The commentator seems to imply that *gati* is worth one-half *mātrā* when attached to a long vowel, one *mātrā* when sung with an augmented vowel (but see ML 2.14, where the fractional duration follows an augmented vowel). Presumably, the preceding vowel would be worth one and one-half and two *mātrās* respectively. But when *gati* is introduced by a semivowel it always lasts one *mātrā*, for *y* is treated as a consonant even though *gati* is not considered a separate syllable. The semivowel is inserted to prevent *vivṛtti* (hiatus) between two successive vowels. The oral traditions show scant adherence to these rules: in many cases *gati* bears a much smaller relationship to the preceding long or augmented vowel than the $1\frac{1}{2}:\frac{1}{2}$ and 2:1 ratios allow. See Examples 8, 24-25, 33, 50-53, 56, 63-64, 70.

3

Vinata, *praṇata*, *utsvarita*, and *abhigīta* are similar to the *svarita* accent due to the inherent complexity of rhythm and time counting: as will be seen shortly, the one-half *mātrā* interval is a characteristic of each. Moreover, the

svarita is unlike the remaining accents (*udātta, anudātta, pracaya*), in that its innate musicality renders it difficult to distinguish long *svarita* syllables from those that are short (see Howard 1986:81-84, 89-91, 107-8). The same is true, for instance, in the case of *utsvarita*, which has a fixed duration regardless of vowel length (see ML 3.6). The *abhigīta* too has the long (two-*mātrā*) time value, although it appears almost exclusively on short vowels (see ML 3.7, Howard 1977:71-75). *Vinata, praṇata,* and so on are compared to the syllables of the *ārcika* for the reason that, like these syllables, they are always worth either one or two *mātrās*. Thus they are distinguished from the *visvarāṇy akṣarāṇi*, which—not counting the exceptions—possess no fewer than five *mātrās* (see ML 1.16, 2.3).

4

Vinata (see Simon 1908:522-23, Simon 1913:315, Howard 1977:69-70) starts with a *svara* of the thumb and ends with a *svara* of the forefinger. *Praṇata* (see Simon 1913: 315, Howard 1977:70) begins with a *svara* of the forefinger and concludes with a *svara* of the middle finger. *Utsvarita* (see Simon 1913:315-16, Howard 1977:70-71) begins with a *svara* of the ring finger and ends with a *svara* of the little finger. *Abhigīta* (see Burnell 1876 : xliv, Simon 1908:517, Simon 1913:316, Howard 1977:71-75) starts with a *svara* indicated by the forefinger and concludes with a *svara* of the thumb.

Originally *vinata* and *preṅkha* may have been one and the same (see Howard: 1977: 65, 113); with $2_{\hat{3}}$, 4_5, and 7 are associated the Jaiminīya symbols *t, pl*, and *y*, respectively (see Howard 1988). *Abhigīta* may have originally been identical to 2_1.

5

Vinata and *praṇata* are either long or short, despite the fact that they are occasionally attached to prolated/augmented vowels. In such cases the *r*-notation either should be present or should be understood to be present. Therefore, on prolated/augmnented or long vowels the *svara* of the higher figure is worth one and one-half *mātrā*; on short vowels it is worth one-half *mātrā*. The *svara* of the lower figure consists of one-half *mātrā*, regardless of whether the syllable is augmented, long, or short (see Simon 1913: 315, Sharma 1965: 40-41, Howard 1977: 69-70). The notation of *vinata* makes use of the *avagraha* or (in South India) the syllable *vi,* both written above the text; *praṇata* may or may not employ the circumflex above the numeral 3.

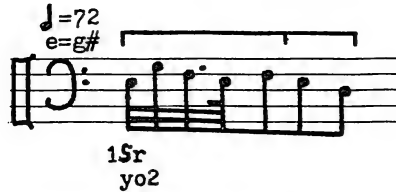

The second Gṛtsamadasya Madaḥ chant, on the verse *yaṃ vṛtreṣu,* has an example of *vinata* on a short vowel. The two Saṃmīlyam chants (ĀrG 51.4-5), on the text *pra yac cakram arāvṇe,* consist almost entirely of bisyllabic *parvans* concluding with *vinata* on short or long vowels. The Saṃmīlyam *sāmanṣ* are found also in the Ūhyagāna (ŪhyG 3.2.12-13: I am grateful to Prof. Tarlekar for informing me that the expression *sye* means, according to Sāmatantrasūtra 639, *rahasye*), but are set here to a different text. The Mahāvairājam (ĀrG 54.1), sung

to the verse *pibā somam indra*, also contains examples of *vinata* on short and long vowels. Other *vinata* examples are from the Bharadvājinām Vratam (ĀrG 100.1), on the verse *abhī navante;* the second Vasiṣṭhavratam (ĀrG 114.2), on the verse *ud u brahmāṇi;* the Vārtraghnam (ĀrG 121.1), on the words *indrasya nu vīryāṇi;* the Kaśyapapuccham (ĀrG 147.1), on the verse *agnir asmi janmanā;* the Mahādivākīrtyam (ĀrG, sixth *stobha* after 155.1), on the words *dharma vidharma satyaṃ gāya;* the Tavaśyāvīyam (ĀrGP); and the Ānandaḥ (ĀrG 160.1), on the verse *ayaṃ gauḥ pṛśniḥ.* Examples of *praṇata* include

2r r 1
ā yāhī3 voi (GG 1.1: Gautamasya Parkaḥ),
2 r ^
tigmenâ (GG 22.1: Haraḥ I),
2 r
manye3 (GG 465.1: Bhāradvājam I), and
1r 2 r r
oṣadhīnā3m (ĀrG 157–159.1: Ādityavratam of the *śukriyaparvan).*

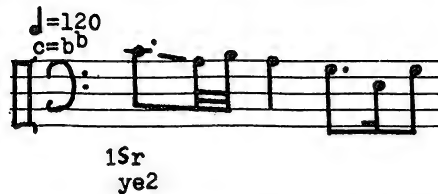

In the following example of *vinata* on a long vowel, a T chanter assigns not two but eight *mātrās* to the sequence. However, one can easily formulate a division into two equal sections: note that the final tone (one-half a section) would be connected with numeral 2.

Example 118 (T). 1 *mātrā* = sixteenth note. Rayiṣṭham (GG 512.2).

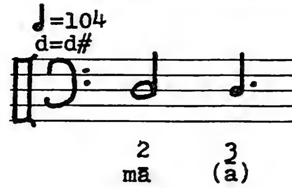

A NK singer adds even more *mātrās* than this; he gives fourteen units to *vinata* on a long vowel. Moreover, the music does not lend itself to the type of partition found in the previous example.

Example 119 (NK). 1 *mātrā* = sixteenth note. Lauśam I and II (GG 237.1-2).

Praṇata too is seen to be much more elongated than the ML prescription states: seven rather than two *mātrās* are heard in this T performance of *praṇata* on a prolated vowel, where the distribution is four + three. Note that the two numerals of *praṇata* are effected on one and the same pitch. Thus the "bent" or "bowed" description of the sequence does not pertain to any musical feature but perhaps instead a salutatory role for *praṇata.* The time ratio $1\frac{1}{2}:\frac{1}{2}$ is not in

evidence here, but the first tone is discernibly longer than its repetition.
Example 120 (T). 1 *mātrā*=eighth note. Vāmadevyam (ŪG 1.1.5).

It is also the NK practice to exceed the prescribed duration and to realize the sequence on basically one tone. *Praṇata* on a prolated vowel is executed here. Nine *mātrās*, with the approximate distribution six + three, result.
Example 121 (NK). 1 *mātrā*=sixteenth note. Gautamasya Parkaḥ (GG 1.1).

A syllable bearing *praṇata* is occasionally extended through the addition of one or more numerals. The sequence 2_{34} is such an example: in this performance, where it occurs on an augmented vowel, the *mātrās* are distributed four + four + two. Note that here 2 and 3 are of identical length, while 4 has one-half their value.
Example 122 (T). 1 *mātrā* = eighth note. Vāco Vratam I (ĀrG *stobha*, before 94.1).

Eighteen *mātrās* apportioned more or less equally among the three figures are achieved in this NK interpretation of 2_{34} on a prolated vowel.
Example 123 (NK). 1 *mātrā*=sixteenth note. Mārutam (GG 445.1).

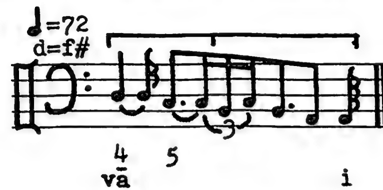

6

A syllable bearing *utsvarita* has the numeral 4 above, followed by number 5 within, the line of text. The *svara* associated with the fourth *mudrā* lasts one-half *mātrā*, that accompanying the low *mudrā* one and one-half *mātrā*. *Utsvarita* ordinarily occurs on long vowels that have the *ārciko 'kṣarakālaḥ* (that is, the two-unit time value: $\frac{1}{2} + 1\frac{1}{2} = 2$). However, on rare occasions

utsvarita is found attached to a short vowel (see Howard 1977: 61): only two examples of this exist in the entire Prakṛtigāna. In these two cases *utsvarita* retains the two-*mātrā* value and does not have the *ārciko 'kṣarakālaḥ* of one *mātrā. Utsvarita* is so named apparently because of a similarity between its execution and that of the *svarita* accent, when the latter occurs on a long vowel. Hence the term *utsvarita* is somewhat inappropriate to the two examples found on short vowels, although it is performed here in exactly the same way as on the long vowels. The falling quality attributed to the *svarita* by the *prātiśākhyas* (see Allen, 1953: 87-88) is found also as an element of *utsvarita* in that the *svara* connected with 4 is tonally higher than that associated with 5. In Sāmavedic chanting it is a general maxim that "the smaller (i.e., "higher") the numeral, the higher the *svara*," although exceptions are commonplace.

That *utsvarita* should last two *mātrās* is denied in this T rendition, which assigns eight + seven = fifteen *mātrās* to the sequence. The four descending pitches neatly divide the sequence into two segments. Apparently only the first tone is connected with numeral 4.

Example 124 (T). 1 *mātrā*=sixteenth note. Gautamasya Caiva Parkaḥ (GG 1.3).

Also exceeding the two-*mātrā* limit are these NK renditions, which contain six and seventeen *mātrās* respectively. The first specimen appears before a following 5, the second before 5_6. It is obvious that here the $\frac{1}{2} : 1\frac{1}{2}$ ratio between the two figures is completely ignored.

Example 125 (NK). 1 *mātrā*=sixteenth note. Gautamasya Caiva Parkaḥ (GG 1.3) and Raudram I (GG 115.2).

7

Abhigīta is indicated by the numeral 7 placed above the syllable in question. This number is a symbol of 2 followed by 1, for *abhigīta* is shown by first placing the thumb on the second finger, then flicking it upwards (see Howard 1977: 80, 85). Numeral 7 is found on both short and long vowels, but it has a fixed duration regardless: one-half *mātrā* is associated with figure 2 (representing the forefinger), one and one-half *mātrā* with 1, the thumb (the commentary, corrected above, reverses these values). An example of *abhigīta* on a short vowel is the following:

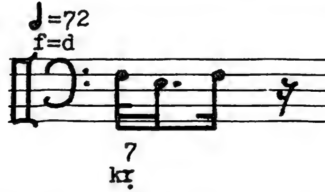

1r 7 4
stomāṃ rudrā23yā (GG 15.2: Jarābodhīyam II).

It is found on a long vowel in the excerpt

2 r 1 7r 111
janayant sūryam a3pāinvo arkā2345iḥ (GG 534.1: Vaiśvajyotiṣam I).

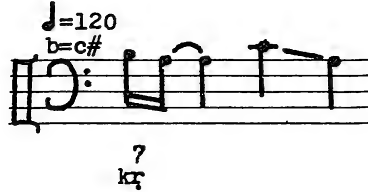

The chanting of *abhigīta* by a T Brāhmaṇ comes very close to the specified duration, surpassing it by only a single *mātrā*. Probably only the first pitch belongs to numeral 2.

Example 126 (T). 1 *mātrā*= sixteenth note. Sāṃvargaḥ (GG 11.1).

On the other hand, a NK Sāmavedī assigns six + eight = fourteen *mātrās* to the same syllable. Here the first two tones are undoubtedly associated with 2, the last two with 1.

Example 127 (NK). 1 *mātrā*= sixteenth note. Sāṃvargaḥ (GG 11.1).

8

When *abhigīta* is extended through the addition of an extra number (always the figure 2), the result is *abhigītakṛṣṭa*. Only two instances of this occur in the entire Prakṛtigāna:

2 1 7 3 5
indraṃ vṛdhā / to2 dhvā234rāi (GG 151.1: Iṣṭāhotrīyam)

and

7 3 5
to2 kṣā234rān (GG 547.4: Āṣkāraṇidhanam Tvāṣṭrī Sāma).

The duration of the *svara* at the commencement of *abhigīta*—that is, that *svara* associated with numeral 2 (7 = 2 followed by 1)—is one-half *mātrā*, as is the case with ordinary *abhigīta*. However, the *svara* of the thumb is extended to two and one-half *mātrās* in *abhigītakṛṣṭa*. In order to avoid the confusion brought about by this fractional measurement of time, some teachers specify three *mātrās* for this *svara*. It can be assumed that the figure 2 notated immediately after 7 signifies a three-*mātrā svara* on the second *mudrā*. Hence a syllable bearing *abhigītakṛṣṭa* lasts either one-half + two and one-half + three = six *mātrās* or one-half + three + three = six and one-half *mātrās*

9

The letter *y* at the end of a word is worth one-quarter *mātrā*, as in the fragment

2r 1 4r r r 5
rāyāy ā23gne mahe tvā hāu (GG 93.2: Āsitam II).

This circumstance occurs when final *i* undergoes change to *y* when a different vowel follows. The one-quarter duration is encountered also as the value of initial *ṛ*, which is a composite of consonantal and vocalic elements (see Allen 1953: 61-62): the beginning or *ṛ* is discarded when the letter begins a word. However, the letter *r* bears the usual consonantal length, one-half *mātrā*. *Svarabhakti,* the vowel sound separating *r* from a following consonant (see Allen 1953: 73-75), usually a fricative, is worth one-half *mātrā*. But in the context *h* + *r* + sibilant, that *svarabhakti* followed by (or following) *r* lasts a full *mātrā;* one and one-quarter *mātrā*s is the value of *r* and *svarabhakti* together.

10

In the Ṛgveda, "gandharva" usually refers only to a single individual, whose activities include measuring space and guarding Soma (see Macdonell 1898: 136). In the Mahābhārata there is

> . . . a distinction between divine gandharvas and human gandharvas . . . . . It says that "Gandharvas well versed in singing and skilled in dancing entertained the priests during the intervals between the ritual acts" (14, 88, 364 3C). . . . . .. That in the Veda gandharvas also mean real human beings, who were present at Vedic sacrifices, is clear from the Śatapatha Brāhmaṇa (11, 2, 3, 7): "Now when the ṛṣis were performing the sacrifice, the gandharvas came near to them. They looked on, thinking, 'Here, surely, they have done too much, here they have done too little.' And when their sacrifice was completed, they pointed it out to them . . . . . ." The gandharvas are spoken of in a hostile tone. . . . .(Parpola 1980: 23)

TRANSLATOR'S POSTSCRIPT

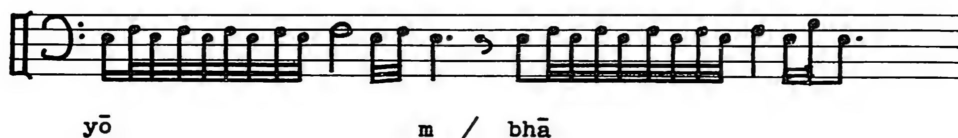

On being confronted with the numerous discrepancies between the edicts of the ML and the oral testimony of the two Kauthuma-Rāṇāyanīya traditions of Tamilnadu and Karnataka, one is tempted to conclude either (1) that the wrong traditions were selected for analysis, or (2) that all present-day Sāmavedic traditions are, from a historical perspective, corrupt. As a rejoinder to the first conclusion I should refer the skeptic to the transcriptions in Howard 1977 and to the analyses in Rajagopalan and Howard forthcoming, where, despite the limitation of materials, it is evident that not a single Sāmavedic community in all of India is in agreement with the ML on each and every point. In refutation of the second conclusion I should make the observation that the ancient Indian's concept of time was markedly different from that of our own. Now it is true that ML 1.14 declares explicitly that "in the *sāman* chants there is melody and evenness of tempo" (*vṛttisamaṃ ca gītaṃ sāmasu*). However, within a given tempo there seems to be a relativistic view of timekeeping:

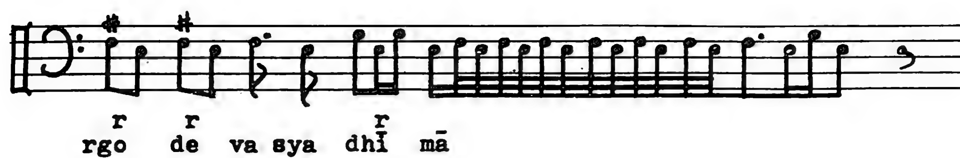

> In Indian music of old times or present times, the time-unit of *mātrā* is to some extent relative. Hence counting the time-units by a metronome would not correctly help the understanding of the rhythm of *Sāman* chant (Tarlekar 1985: 15).

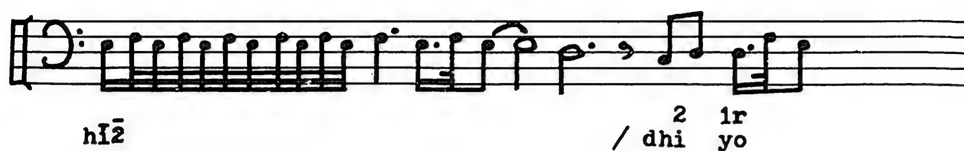

Even the eleventh-century commentator on the Nāṭyaśāstra, Abhinavagupta, expressed the belief that time is incapable of being measured absolutely. Both he and St. Augustine of Hippo (Algeria), who lived six centuries earlier, are of the opinion that "temporality in music is manifested by internal structure not by fixed durational values" (Rowell 1982: 27). With this philosophy of relativism in mind, is it any wonder that, for instance, an augmented syllable with ten times the duration of a short syllable is said to contain only three *mātrās?*

In the foregoing notes on the ML and its commentary only fragments of chants are transcribed for illustrative purposes. It will be instructive to include here a complete chant, the Gāyatram, in order to show the change in the value of *mātrā* from one syllable to the next—assuming, of course, that the larger segments and divisions postulated earlier correspond to *mātrās* and hence that the temporal unit's duration is not rigidly maintained as the length of a short vowel. The chanter is Śrī P. T. Govinda Aiyaṅgār of Srirangam, who sings in the Tanjore style.

In this performance a short syllable not followed by conjuncts or a change in notation lasts .29 second. The value of the *mātrā* stays the same or changes from syllable to syllable. In parentheses after each syllable is the number of *mātrās* that it should contain (according to my analyses above and not always according to the ML).

tat	($1\frac{1}{2}$):	. 29 + $\frac{1}{2}$ (.29)
sa	(1):	.29
vi	(1):	.29
tur	($1\frac{1}{2}$):	.29 + $\frac{1}{2}$(.29)
va	(1):	.29
re	(3):	.73 + .58 + .58
ṇi	(1):	.29
yōm	(1):	.73 + 1.16 + 1.02
bhār	(3):	.87 + .58 + .58
go	(2):	.29 + .29

naḥ	(2):	.29 + .29
pra	($1\frac{1}{2}$):	.29 + $\frac{1}{2}$(.29)
co	(15):	.48 + .48 + .48 + .87 + .73 + 1.02 + .48 + .48 + 48 + .1.02 + .73 + 1.16 + .58 + .58 + .58
him	(3):	.73 + .44 + .58
ā	(6):	1.31 + .73 + 1.02 + 1.02 + .73 + .73

dā	(2): .73 + 1.02
yo	(3): 1.02 + .73 + .87
ā	(6): .58 + .58 + .58 + 1.74 + 1.89 + 1.60

In this chant the *mātrā's* length varies from a low of .29 second to a high of 1.89 second. The concept of an adjustable or floating *mātrā* must be a trait of each and every Sāmavedic chant; otherwise many of the ML's statements would be utterly without validity.

INDEX OF SĀMANS

GENERAL INDEX

Wayne Howard (b. 1942: Ph.D., Indiana University, 1975) began his study of the Sāmaveda in 1970, when he started a fifteen month stay in India as a Fulbright Scholar. The first result of his field research was the publication of his dissertation, *Sāmavedic Chant* (Yale University Press, 1977). In addition to the *Mātrālakṣaṇam* edition/translation presented herein, Howard has written two other books: *Veda Recitation in Vārāṇasī* (Motilal Banarsidass, 1986) and *The Decipherment of the Sāmavedic Notation of the Jaiminīyas* (Vol. 63 of *Studia Orientalia*, edited by the Finnish Oriental Society of Helsinki, Finland, 1988).

Howard has contributed articles and book reviews to the *Indo-Iranian Journal*, *The Journal of Asian Studies*, the *Journal of the American Oriental Society*, the *Academic American Encyclopaedia*, and *The World of Music*, as well as to special publications such as *Prof. E.R. Sreekrishna Sarma Felicitation Volume*, *Dr. B.R. Sharma Felicitation Volume*, and *Agni: The Vedic Ritual of the Fire Altar.*

Presently he has planned several collaborations with other scholars, including the critical edition of the entire song corpus of the Jaiminīya Sāmaveda with Prof. Asko Parpola.
